MILCON:

PE 00000445, 00000446, 00000447, 00000448, 00000763

5. (U) Related Programs:

M77 Munitions, Bradley Fighting Vehicle (BFV), TACFIRE, 10-Ton Truck/Trailer, Scatterable Mine Warhead (German Development), Field Artillery Meteorological Data System, Test Set AN/USM-410, Army Tactical Missile System (Army TACMS) and Advanced Field Artillery Tactical Data System (AFATDS).

6. (U) Mission and Description:

(U) The MLRS is a Multiple Launch Rocket System designed to supplement cannon weapons available to U.S. Division and Corps Commanders for the delivery of a large volume of firepower in a very short time against critical, time sensitive targets. The MLRS Launcher fires both a dual-purpose improved Conventional Submunition Warhead on the M77 Rocket and an improved Conventional Submunition Warhead on the Army TACMS. It provides an all-weather, indirect fire capability both at midrange and at depth to attack the enemy's indirect fire weapons, air defense systems, and Light Materiel and personnel targets in sufficient quantities and density to saturate available cannon weapon fire support. The system has the growth potential to adapt follow-on warheads such as Terminal Homing Munitions, Scatterable Antitank Mines, and smart submunitions to be fired on rockets, ballistic missiles and cruise missiles.

(U) The system consists of a M270 launcher, two disposable pods containing six rockets each, a Fire Control System, and an Azimuth Position Reference Unit. The M270 launcher is also the launch platform for the Army TACMS missile. The carrier is a derivative of the BFV which uses the same engine, transmission, and other mechanical systems. The MLRS carrier is designated M993. The rockets/missiles are loaded in the launch pods at the factory. They are shipped, stored in the pods and fired from the pods. Fuze settings are accomplished automatically by the Fire Control System.

(U) The system is designed for quick reaction with the capability of firing the first round within minutes of receipt of a fire mission and firing the complete load of 12 rounds in 60 seconds. MLRS will fill a firepower gap and be used to replace the eight-inch howitzer as a result of obsolescence and downsizing of the Army.

(U) The Improved Fire Control System (IFCS) will correct present and future supportability problems in the current MLRS Fire Control System resulting from electronic component obsolescence in the existing design. This effort will result in reduced operation

\*\*\* UNCLASSIFIED \*\*\*

MLRS Rocket System, December 31, 1995

6. (U) Mission and Description (Cont'd):

and support costs and will provide growth capabilities for existing and future MLRS Family of Munitions (MPOM) weapon systems. The Extended Range-MLRS (ER-MLRS) rocket will enhance the capability of the existing MLRS by providing improvements in range, accuracy, effectiveness, and maneuver force safety (improved submunitions with self destruct fuze). The improved launcher will have the capability to support ATACMS Block 1A and Block II. The Improved Launcher Mechanical System (ILMS) will decrease the stow to aim point timeline, enhance effectiveness in engaging and supporting the force, and increase MLRS platform survivability.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --  
The Department Of The Army (DA) approved a Letter Of Agreement (LOA) for MLRS in September 1975. In January 1977, the Defense System Acquisition Review Council I (DSARC I) approved MLRS to enter validation with two competitive contractors and an option to later enter Maturation/Low Rate Production (LRP) with either one or two primes. In September 1977 Boeing, Seattle and Vought, Dallas were awarded competitive Validation Contracts for a period of 29 months which was later extended to a 32-month effort for incorporation of design changes to satisfy the German requirement for a Scatterable Mine Warhead. In July 1979, a Memorandum Of Understanding (MOU) on a Cooperative Program was signed by France, Germany, United Kingdom, and the United States. In 1982, Italy was admitted as an associate member of the Basic MLRS Program. The Validation Phase of the program was successfully completed on schedule, within cost, and within Decision Coordinating Paper (DCP) Development Test (DT)/Operational Test (OT) thresholds. The DSARC III held in May 1980 gave approval for MLRS to proceed into maturation, LRP, and initial production facilitization with a Full-Scale Production decision in March 1983. The Terminal Guidance Warhead program was initiated with approval of a LOA in October 1980.

(U) A General Officer Program Review (GOPR) conducted in March 1983 led to a Full-Scale Production decision in March 1983. MLRS was type classified standard in April 1983. The Initial Operational Capability (IOC) MLRS Battery was fielded in March 1983 at Fort Riley, KS. The first overseas unit was deployed to Europe September 1983 in Baumholder, Germany. The first multiyear contract was awarded in September 1983 to LTV Aerospace and Defense Company (LTVAD) to cover a 5-year firm fixed price contract with an Economic Price Adjustment Clause with a negotiated two-year option (FY88/FY89). The second multiyear procurement contract was awarded 30 June 1989 for a 5-year period (FY89-FY93).

MLRS Rocket System, December 31, 1995

7a. (U) Program Highlights (Cont'd):

(U) MLRS performed extremely well in Operation Desert Storm (ODS), when significant numbers of MLRS Launchers were deployed. All operational requirements were met and, in most cases, exceeded for readiness, reliability, accuracy and maintainability. MLRS units from other coalition members were also involved in ODS and proved the value of the successful operation of this multi-national system. The newly upgraded MLRS (Deep Attack Launcher) demonstrated its enormous capability during first operational firing of the longer range Army TACMS. The 500th MLRS production launcher rolled out in February 1991.

(U) Second source qualification status was awarded to the European production line in February 1992. IFCS and ER-MLRS entered Engineering/Manufacturing Development (EMD) in 1992. EMD contracts were awarded to Loral Vought Systems (LVS). IFCS will mitigate electronic obsolescence, reduce operation and sustainment (O&S) burden, accommodate needs of present weapon systems under development and provide growth for future weapon systems which will use the MLRS M270 launcher platforms. All IFCS Design Reviews were successfully conducted on schedule.

(U) The need for ER-MLRS was identified in Lessons Learned from ODS. The ER-MLRS, a successor to the basic M26 rocket, will provide increased range, improved accuracy, lower dud rates, and has potential to provide a low cost delivery vehicle for future smart munitions at extended ranges. The ER-MLRS rocket program began flight testing in May 1994. Twelve rockets were successfully tested in the May-June 1994 timeframe.

(U) A bilateral MOU between Japan and the United States for Japanese production of MLRS was signed January 4, 1993. (Japanese production is scheduled to begin in 1996.) Japan is procuring at least 36 launchers and a quantity of tactical and practice rockets over the next four years under Foreign Military Sales.

(U) A Value Engineering Change Proposal (VECP) was used to prove the concept of the Reduced Range Practice Rocket (RRPR). The RRPR, known as M28A1, went into production in July 1993.

(U) The first tactical fielding of the Fire Direction Data Manager (FDDM) took place in September 1993.

(U) The M270 Family of Munitions Command and Control/Fire Direction Data Manager (MFOM/FDDM) Product Office completed its support and chartered mission in June 1994.

\*\*\* UNCLASSIFIED \*\*\*

MLRS Rocket System, December 31, 1995

7a. (U) Program Highlights (Cont'd):

(U) The first completely tactical MLRS AT-2 multinational flight test was successfully conducted in October 1994 at White Sands Missile Range (WSMR), NM.

(U) Congress authorized the Army to initiate the ILMS program in FY95 in order to recognize savings by synchronizing ILMS retrofit schedule with the IFCS.

b. (U) Significant Developments Since Last Report --  
The first Improved Fire Control System Engineering Design Test (EDT) Line Replaceable Unit was delivered in March 1995. The first two full sets of EDT hardware were delivered in November 1995. Laboratory testing indicates all subsystems meet technical performance requirements. Low level hardware and software integration were successful. Engineering releases were completed for all Computer Software Configuration Items.

(U) Six Extended Range-Multiple Launch Rocket System rocket pods were flight tested at the French CEM test range in January 1995. Lone Star Army Ammunition Plant, Texarkana TX, successfully completed the self destruct fuze process validation in September 1995. In December 1995 322 submunitions were flown at White Sands Missile Range; 316 were recovered with only three failures. A success rate of 99.05 percent was achieved which meets the operational requirement.

(U) The Improved Launcher Mechanical System Request for Proposal was released in March 1995. A Preliminary Design Review of the Power Take-Off Unit was successfully completed at United Defense Limited Partnership in May 1995. Milestone II Decision approval was received in July 1995 and an Engineering and Manufacturing Development contract was awarded in August 1995.

(U) The MLRS is expected to satisfy mission requirements.

(U) It is anticipated that this will be the final Selected Acquisition Report (SAR) for the M270 MLRS weapon system. Ninety percent of production deliveries have been achieved. This final report will not be used for unit cost reporting purposes. Included in this final SAR are stand alone schedule parameters for each program.

c. (U) Changes Since As Of Date -- None.

8. (U) Threshold Breaches:

There are currently no breaches to the approved Acquisition Program Baseline of June 17, 1993. There are no Nunn-McCurdy unit cost

b. (U) Previous Change Explanations --

The schedule variances for milestone Initial Production Delivery through IOC are due to the FMC strike which resulted in a four month slip in the MLRS program schedule. ASARC IIIB was downgraded to a General Officer Program Review (GOPR) by the Army. The GOPR approved MLRS to enter Full Scale Production at Milestone IIIB.

Delay in Multiyear II contract award (from March 1989 to June 1989) was due to change in requirements, quantity increases, and

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

MLRS Rocket System, December 31, 1995

9b. (U) Schedule (Cont'd):

difficulty encountered with finalization of contract negotiations.

MYP-II Program Year (PY) 4 and PY5 Awards changed from October 1991 and October 1992 as reflected in the SAE Approved Program Baseline, dated February 26, 1990 to November 1991 and November 1992, respectively, to reflect a more realistic estimate of contract awards based on fund availability.

MYP-II PY3 Award changed from November 1990 to December 1990 and MYP-II PY1 changed from December 1990 to November 1990 to reflect award and start of deliveries.

First Delivery MYP-II PY3 changed from April 1992 to May 1992, First Delivery MYP-II PY4 changed from April 1993 to February 1993 and First Delivery MYP-II PY5 changed from April 1994 to February 1994 to reflect contract definitization September 30, 1991.

MYP-II PY5 Award date was changed from November 1992 to December 1992 to reflect date of award. First Delivery MYP-II PY5 date was changed from February 1994 to May 1994 due to conversion of planned tactical rockets to practice rockets. Both the IFCS and ER-MLRS successfully completed In Process Reviews in 1992 and received Milestone II approval to enter EMD. These are the initial entries for ER-MLRS.

The IFCS PDR Complete date was rescheduled from November 1993 to February 1994 as a result of impacts caused by late contract award due to acquisition process leadtime and delayed definitization until October 1993.

The ER-MLRS CDR Complete date Current Estimate changed from February 1995 to December 1994 to reflect actual completion of the review.

c. (U) Current Change Explanations --

(Ch-1) PPQT Start Date Current Estimate changed from October 1996 to January 1996, PPQT Complete Date Current Estimate changed from February 1997 to April 1996, PQT Start Date Current Estimate changed from July 1998 to February 1998, PQT Complete Date Current Estimate changed from September 1998 to April 1998, as a result of acceleration of ER-MLRS program.

Demon-

(b)(1)

Under Production Hardware Characteristics:

Rocket Fly-to-Buy (FTB) reliability was based on production contract rocket FTB Acceptance Requirements. FTB was performed on each lot of rockets (1 month production, but not more than 500 Rocket Pods).

Accuracy numbers were based on precision error standard deviation of a ripple firing of six rockets.

Armored Vehicle Multiple Rocket Launcher (AVMRL) PRAT numbers were based on production contract launcher PRAT Acceptance Requirements.

\*\*\*CONFIDENTIAL\*\*\*

MLRS Rocket System, December 31, 1995

10b. ~~Rel~~ Performance Characteristics (Cont'd):

b. (U) Previous Change Explanations --

- (1) (U) Maximum range decrease of 3km (35km to 31.8km) meets the system threshold. It is not cost effective to go from 32km to 35km because 16.5% of the munitions must be given up to reach only 1.9% more targets

(b)(1)

c. (U) Current Change Explanations --

(Ch-1) Rockets Fly-to-Buy Reliability Current Estimate changed from .97 to .98, due to recent testing.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised escalation indices. Adjustment for Negative Program Change.

Engineering: New RDT&E effort for IFCS. Initial funding of ER-MLRS. Additional funding of IFCS. New RDT&E effort for ILMS.

Estimating: Increase in cost based on Validation Phase (VP) program; deletion of RDT&E effort funded by MOU contribution; adjustment in prior year escalation and deletion of anticipated reprogramming. Residual RDT&E requirements resulting from operational testing and development of program sets for system automatic test equipment.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

MLRS Rocket System, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

Conversion of prior base-year dollars to then-year and cost growth on finalization of R&D contract. Decrease in the estimate for IFCS. Adjustment for current and prior inflation. Adjustment resulting from OSD "set aside". Increase in funding for IFCS during FY94-97. Decrease in the estimate for ER-MLRS during FY93-97. Adjustment for current and prior inflation.

Other: 11-week strike at FMC resulting in a 4-month slip in the program schedule.

Procurement

Economic: Revised escalation indices. Adjustment for negative program change.

Quantity: Changes in the originally approved MLRS force structure planning estimate of 183 launchers are an additional 667 launchers, 154,278 tactical rockets, and 22,770 practice rockets. Additional changes resulted from a reduction of the total program of 7 launchers, 60,000 tactical and 16,776 practice rockets. Increase of 20,286 tactical rockets in FY91 to replace assets used in Operation Desert Storm. Increase in FY91 of 3714 tactical rockets and 5592 practice rockets and decrease of 14 launchers. Increase in FY92 of 99 launchers and 23,760 practice rockets. Decrease in FY92 of 2250 tactical rockets. Reduction in FY93 of 184 launchers and 462 tactical rockets. Increase of 20 National Guard launchers. Total launchers increased from 734 to 754. Increase in funding to procure 10344 ER-MLRS rockets in FY95-01. Increase of practice rockets from 62994 to 72132 in FY94-95.

Schedule: Restoration of production rate. Establishment of a multiyear procurement. Cost savings associated with decrease in procurement buys for launchers. Cost increase in FY92 resulting from the stretch-out of launcher procurement schedule. Additional cost increase due to the change in tactical rounds procurement schedule.

Engineering: Procurement costs associated with the ER-MLRS. Additional funding to procure 10344 ER-MLRS rockets in FY95-01. Product Improvement to the configuration of the tactical rocket.

Estimating: Revised round and launcher cost based on VP program. Revised cost estimate for maturation phase changes to Low Rate Production hardware. Adjustment in prior year escalation; deletion of

- 16 -

\*\*\* UNCLASSIFIED \*\*\*

MLRS Rocket System, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

anticipated reprogramming. Increase in base-year dollars; realignment of advanced materials funding. Estimate associated with quantity changes and reduction of administrative services; reduction in cost of submunitions and revised Economic Price Adjustment forecast multiyear contract. Additional funds for competition-quantity. Expanded MLRS force structure. Variance between actual cost and baseline cost of additional launchers. The overall decrease in production quantities resulted in production and overhead inefficiencies. Increase production and overhead cost resulting from the increase of 20,286 tactical rockets. Correction of prior SAR variances to reconcile Flyaway and Support. Increased cost due to shut down of Bradley line in FY 94. Increased cost due to lower launcher production rates in FY 94-97. Revised estimate due to rocket production termination in FY 93. Adjustment for current & prior inflation. Increase in carrier unit cost (FY93-FY94) due to going from MYP to single-year production for Bradley and MLRS launchers. Reduced estimate in launcher funding in FY94 to maintain a warm production base. Additional funding in FY95 and FY96 associated with fielding of previously procured launchers. Decrease due to cancellation of warm line rocket funding in FY95-99. Initial funding for start of ER-MLRS in FY99. Transfer in funding for tactical rocket line to practice rocket line in FY94. Decreased funding to launcher line due to reprogramming in FY94 to rocket line, and mod line. Additional funding for 20 launchers for National Guard. Additional funding in FY95-96 for fielding of previously procured launchers.

Other: Eleven-week strike at FMC resulting in a four-month slip in the program schedule.

Support: Refinement of funding requirement for initial spares. Additional spares required to support expanded force structure. Initial spares in FY91 and FY92 were purchased with Army Stock Fund. Support requirements extended three years. Funding for Payroll, Travel, Contracts, Total Package Fielding, New Equipment Training, and First Destination Transportation for FY92-97 changed from OMA to MIPA funding. Correction of prior SAR variances to reconcile flyaway and support.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

MLRS Rocket System, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

Revised estimate of initial spares costs.  
Adjustment for current and prior inflation.  
Transfer of consumable spares from initial spares line to launcher line. Increased other weapon system cost to support launcher and ER-MLRS.  
Reduced Initial Spares requirements associated with quantity decrease. Decrease in data requirements associated with decrease in launcher quantities. Reduced Initial Spares requirement.  
Increase in data requirements associated with increase of 20 National Guard Launchers.  
Adjustment for current and prior inflation.

MILCON

Economic: Revised escalation indices.  
Estimating: Addition of MILCON funding requirements to SAR, revised estimate and increase in construction requirements. Refinement of MILCON requirements. Historically MIPA indices had been used to calculate these values, however; MILCON indices were used this year to make proper adjustments. Additional funding in FY 91 of \$1.9M. Adjustment for current and prior inflation.

|       | FFP     | Quantity<br>Launcher/Tactical/Practice |
|-------|---------|--|
| MYP-1 | \$176.2 | 62/17,490/570                          |
| MYP-2 | \$198.7 | 41/24,000/120                          |
| MYP-3 | \$210.6 | 44/24,000/1,878                        |
| MYP-4 | \$174.0 | 44/24,000/5,592                        |
| MYP-5 | \$182.5 | 44/24,000/5,592                        |

Current Contract Price (\$M)

|           | FFP<br>(Includes only Army funds) | Quantity<br>Launcher/Tactical/Practice<br>(Includes only Army quantities) |
|-----------|-----------------------------------|---|
| MYP-1     | \$178.4                           | Same as initial   |
| MYP-2     | \$208.3                           | Same as initial   |
| MYP-2-OPT | \$127.7                           | 27/16,788/3,756   |
| MYP-3     | \$211.4                           | Same as initial   |
| MYP-3-OPT | \$97.9                            | 22/12,000/0*  |
| MYP-4     | \$167.6*                          | 44/20,286/9306  |
| MYP-5     | \$130.0*                          | 44/270/20,046   |

\*--The changes to MYP-3,4, and 5 were due primarily to VECF, waivers, and EPA adjustments. The decrease in MYP-5 is a result of the additional conversion of tactical rockets to FMS requirements, as well as the above.

16. (U) Program Funding Summary (Current Estimate in Millions of Dollars):

a. (U) Program Status --

- (1) Percent Program Completed: 80.8% (21 yrs/26 yrs)
- (2) Percent Program Cost Appropriated: 95.1% (\$6470.2 / \$6802.8)

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

The unit for tracking O&S costs is a firing battery. The O&S costs are estimated in an annual Program Office Estimate (POE) (Latest validation Sep 94) update. The POE updates operating tempo, reliability/maintainability, maintenance concept, manning and logistics policies. This POE information is integrated into the annual update of the MLRS O&S Cost Reduction Program and provides the methodology to portray the O&S costs per battery. A typical operating year is selected from the annual POE update and divided by the number of MLRS batteries deployed to give an O&S cost per battery. This typical operating year is a point in time after the completion of fielding, when the operating and support costs are neither increasing nor decreasing in magnitude due to fielding changes. There is no antecedent program for MLRS.

6. (U) Mission and Description:

PATRIOT, the centerpiece of the Army's corps and theater air defense forces, is an extremely capable high-to-medium altitude, long-range air defense missile system which provides air defense of ground combat forces and high-value assets against the air threat of the 1990s and beyond. PATRIOT is designed to cope with enemy defense suppression tactics that may include tactical ballistic missiles (TBM), cruise missiles, anti-radiation missiles, advanced aircraft employing saturation, maneuver, sophisticated electronic countermeasures (ECM), and low radar cross-section. In the Field Army, PATRIOT air defenses will be complemented by short-range, low altitude forward area defense weapons and will be integrated with other ground and air assets in the overall air defense of the theater of operations. The system can conduct multiple simultaneous engagements of high performance air breathing targets and TBMs with a high probability of target kill. The system will provide air defense protection in all weather conditions and in hostile ECM environments. At the battery level or Fire Unit (FU) level, the PATRIOT missile system consists of an Engagement Control Station (ECS), one Radar Set (RS), an Electric Power Plant (EPP), eight Launching Stations (LS), and associated communications equipment. At the battalion level, command and control is exercised through the Information and Coordination Central (ICC) and associated communications equipment including Communications Relay Groups (CRG). The PATRIOT RS is a multifunction phased array radar which performs a variety of surveillance, acquisition, and guidance tasks. The only manned element of the FU during air battle, the ECS, provides the human interface for control of automated operations.

The PATRIOT Advanced Capability (PAC-3) program is the result of a series of integrated, phased system improvements in combination with the PAC-3 missile (formerly ERINT). The PAC-3 missile is a high velocity hit-to-kill, surface-to-air missile capable of intercepting and destroying tactical missiles and air breathing threats. The PAC-3 missile provides the range, accuracy, and lethality to effectively defend against tactical missiles with nuclear,

\*\*\* UNCLASSIFIED \*\*\*

PATRIOT PAC-3, December 31, 1995

6. (U) Mission and Description (Cont'd):

conventional high explosive, biological and chemical warheads. The missile uses a solid propellant rocket motor, aerodynamic vane controls, and inertial guidance to navigate to an intercept point. Shortly before arrival at the intercept point, the missile's rate of spin is increased, the on-board radar homing seeker acquires the target, and terminal homing guidance is initiated to achieve hit-to-kill by high resolution maneuvers.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

The PATRIOT PAC-3 program is the evolution of the phased materiel change improvement program and new missile procurement to upgrade PATRIOT System performance. As a result of evolving threat and analysis of PATRIOT performance in Operation Desert Storm, several system upgrades are being implemented. These upgrades include the PAC-3 missile, radar enhancements, communications upgrades, and increased computer capability. In February 1994, the Army Systems Acquisition Review Committee (ASARC) made a down-select recommendation to proceed with development of the Extended Range Interceptor (ERINT) as the PAC-3 missile, in lieu of the Multimode missile. The Defense Acquisition Board (DAB) conducted a Milestone IV/II review on 19 May 94. The PAC-3 missile was approved for entry into the Engineering and Manufacturing Development (EMD) phase. The PAC-3 Missile Development contract was awarded to Loral Vought Systems on 26 October 1994, and the Missile Integration contract was awarded to Raytheon Company on 31 October 1994. The PAC-3 program is funded by both the Army and the Ballistic Missile Defense Organization (BMDO).

b. (U) Significant Developments Since Last Report --

The PAC-3 missile Preliminary Design Review (PDR) was successfully conducted in August 1995. The PDR examined missile and command and launch specifications, hardware and software functional allocations, major design trades, and risk assessments. The missile development effort was directed to proceed toward the Critical Design Review milestone in March 1996.

In September 1995, the Program Executive Officer for Missile Defense (PEO-MD) approved a limited procurement of six Radar Enhancement Phase III modification kits and associated spares. In December 1995, the PEO-MD authorized full production for up to sixty-nine additional Radar Enhancement modification kits and spares. The production decisions represent successful testing which demonstrated the Radar Enhancement Phase III development program objectives.

The Configuration 1 First Unit Equipped (FUE) was declared on 21 December 1995 with 2-7 Air Defense Artillery, at Fort Bliss, TX.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

PATRIOT PAC-3, December 31, 1995

7b. (U) Program Highlights (Cont'd):

The Configuration 1 FUE also included materiel release of the Guidance Enhancement Missile. Configuration 1 enhances the PATRIOT system to improve overall system throughput and expandability as well as improve system performance against Tactical Ballistic Missile and Cruise Missile threats.

The PATRIOT PAC-3 System is expected to satisfy mission requirements.

c. (U) Changes Since As Of Date --

Recent budgeting decisions caused significant replanning of the PAC-3 program. These budgeting decisions are being validated through BMDO program replanning. Therefore a current comprehensive BMDO program plan is not available for this December 1995 SAR.

The December 1995 SAR content, especially the program current estimate, reflects program information truncated at FY01, consistent with recent budgeting decisions. This SAR contains blanks or "To Be Determined" in place of outyear funding and therefore the current estimate only reflects totals through FY2001. Similarly, the schedule milestones only reflect estimates contained in recent budgeting decisions.

Truncation of program estimates creates artificially negative cost variances as shown in Section 13. Program totals and cost variances will significantly change once BMDO/Army complete and report on the new program estimate. BMDO plans to submit an exception SAR reflecting total program estimates to Congress in May, for the quarter ending March 31, 1996.

8. (U) Threshold Breaches:

There are schedule and cost threshold breaches to the approved Acquisition Program Baseline, dated 22 Feb 95. As part of the new estimate development for the PAC-3 program, a Program Deviation Report and proposed APB will be submitted.

There are no Nunn-McCurdy unit cost breaches.

b. (U) Previous Change Explanations -- None.

c. (U) Current Change Explanations --

(Ch-1) Preliminary Design Review Complete changed from SEP 95 to OCT 95, Configuration 1 Production Confirmatory Test changed from MAR 95 to SEP 95, and Configuration 1 First Unit Equipped changed from JUN 95 to DEC 95 to indicate accomplished Milestones.

(Ch-2) Milestones listed as TBDs changed from the Approved Program objective date until BNDO/Army completes the new program estimate.

(Ch-3) Non-APB milestone estimate contained in the recent budget

~~SECRET~~

PATRIOT PAC-3, December 31, 1995

9c. (U) Schedule (Cont'd):

decisions that have yet been validated through BMDO replanning.

(Ch-4) Schedule Milestones contained in the recent program budget decisions have yet been validated through BMDO replanning. The Full Rate Production contract award and First Unit Equipped changed from AUG 98 to JUN 99 and from SEP 98 to SEP 99, respectively, to reflect estimates explicitly stated in recent budget decisions. These estimates also exceed APB thresholds.

| Engineering          | -      | -      | -      | -      |
| Estimating           | -189.9 | -172.6 | -      | -362.5 |
| Other                | -      | -      | -      | -      |
| Support              | -      | -8.5   | -      | -8.5   |
| Subtotal             | -189.9 | -181.1 | -      | -371.0 |
| Current Changes:     |        |        |        |        |
| Quantity             | -      | -      | -      | -      |
| Schedule             | 68.0   | -      | -      | +68.0  |
| Engineering          | -      | -      | -      | -      |
| Estimating           | 436.6  | 16.7   | -      | +453.3 |
| Other                | -      | -375.3 | -      | -375.3 |
| Support              | -      | -      | -      | -      |
| Subtotal             | +504.6 | -358.6 | -      | +146.0 |
| Total Changes        | +314.7 | -539.7 | -      | -225.0 |
| Current Estimate     | 2330.3 | 2243.5 | -      | 4573.8 |

This current estimate truncates the program at FY2001, as the remaining program is being defined. This lack of program definition after FY2001 generates negative "Other Changes." The current estimate will significantly change as BMDO/Army prepare a new program estimate based on the replanning and restructuring of the PAC-3 program.

b. (U) Previous Change Explanations --

RD&E

Economic: Revised escalation indices.

Estimating: Revised estimates for PAC-3 missile development, Multimode and ERINT DEM/VAL missile downselect, missile risk mitigation, and realignment of radar requirements.

| Previous Cumulative Variances           | \$-17.8 | \$-4.1 |
| Cumulative Variances To Date (12/31/95) | \$-24.9 | \$-2.1 |
| Net Change                              | \$-7.1  | \$2.0  |

Explanation of Change:

This contract contains five independent tasks with varying periods of performance. The tasks are: Pulse Doppler Processor (PDP), Expanded Weapon Control Computer (EWCC), Responsive Threat Analysis, Radar Enhancement Phase III, and Classification, Discrimination, and Identification Phase III (CDI-3). The PDP, EWCC, Responsive Threat, and Radar Enhancement Phase III tasks have been completed. The PDP, EWCC, and Responsive Threat tasks are Army P3I funded, and the Radar Enhancement and CDI-3 tasks are BMDO funded.

The change in the Current Contract Target Price is due to contract modifications for the CDI-3 task. The increase in the cumulative unfavorable cost variance is primarily due to overruns in the Radar Enhancement Phase III development task which completed in Nov 95.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

PATRIOT PAC-3, December 31, 1995

15. (U) Contract Information (Cont'd):

The variances were driven by redesigns of transmitter and exciter subassemblies; increased complexity in test equipment design; and extended testing and evaluation of the modification hardware. The favorable change in the cumulative schedule variance is due completion of past due activities in Factory Test Equipment design and hardware fabricating associated with the Radar Enhancement Phase III task. The remaining contract effort is CDI-3.

There are no significant impacts to the contract because of the unfavorable variances.

Explanation of Changes:

This contract contains six independent tasks with varying periods of performance. The tasks are: Guidance Enhancement Missile (GEM), Improved Launcher, Improved Propulsion, Multimode Risk Reduction, Routing Logic Radio Interface Unit (RLRIU) Upgrade, and Components and Hardware. The RLRIU Upgrade and GEM tasks are Army P3I funded, and the other tasks are TMDI funded.

The cumulative schedule variance is primarily associated with the Improved Propulsion task which was directed to stop work in Feb 94 as a result of the ASARC decision to proceed with ERINT as the PAC-3 missile. The variance for the Improved Propulsion task reflects accomplishment against the original schedule, however, remaining contract effort was descoped based on the stop work order and the schedule was not replanned.

The GEM task was the primary contributor to the unfavorable cost variance at completion. The overrun was attributable to delays in conducting GEM flight tests. All other tasks completed at target cost. This contract has met the 90% completion criteria and this is

Explanation of Changes:

The PAC-3 Missile Engineering and Manufacturing Development (EMD) contract was awarded as a letter contract on 26 Oct 94 and definitized on 7 Nov 95 at a Target Price of \$515.8M. Contract modifications have been incorporated but not definitized for risk mitigation; additional flight tests; and update of and compliance with the Security Classification Guide at an additional NTS price of \$66.7M.

The cumulative unfavorable variances are based on the Nov 95 definitized contract Performance Measurement Baseline (PMB). The PAC-3 program is being restructured based on funding guidance contained in the approved Program Budget Decision 224. The program restructure will add scope, schedule, and funding to the contract to mitigate risk in the EMD effort. The contract PMB will be revised to implement the program restructure.

Although variances to date indicate unfavorable performance, assessment of overall contract performance at completion is not meaningful at this time due to the impending program restructure.

Explanation of Change:

The PAC-3 Missile Segment Integration contract was awarded on 31 Oct 94 at a Not-to-Exceed price of \$120.8M. The contract was definitized on 23 Oct 95 at a Target Price of \$104.8M.

The cumulative cost variance is insignificant. The cumulative unfavorable schedule variance is primarily due to delays in performance of software development and systems engineering activities.

There is no significant impact to the contract because of the unfavorable schedule variance.

Explanation of Change:

Cost and Schedule variance reporting is not required on this FFP contract.

The Radar Enhancement Phase 3 Modification Kits contract for six modification kits and spares was awarded on 29 Sep 95, at a Not-to-Exceed (NTE) price of \$90.2M. The initial contract award was a limited procurement to support program test and evaluation. A full production decision was authorized in Dec 95 for up to sixty-nine additional modification kits and spares to retrofit the balance of PATRIOT Fire Units. A contract modification for procurement of sixteen kits and spares was awarded on 29 Dec 95, at an NTE price of \$123.1M.

This contract is Firm Fixed Price with no requirement for cost performance reporting.

The Program Acquisition Unit Cost (PAUC) unit of measure is tactical Fire Units (FUs) and all FUs have been procured and fielded. The end item quantities reported above are missile procurements. Non-recurring procurement costs include all costs except missile hardware costs.

Program definition and corresponding funding/quantities beyond FY2001 are unavailable as BMDO/Army PAC-3 replanning is underway. However missile quantities remain at 1200.

17. (U) Production Rate Data:

- a. (U) Deliveries to Date -- 0/0.
- b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

- a. (U) Assumptions and Ground Rules --

The O&S assumptions and costs are based on PATRIOT Operating Tempo, Fire Unit Mean Time Between Failure (MTBF), and the PATRIOT Baseline Cost Estimate dated February 1994.

The concept of operation is 54 tactical Fire Units (FUs). The costs are the direct cost to support the primary personnel and to operate the FUs. The O&S consumables are replenishment spares, repair parts, and petroleum, oil and lubricants (POL). The Direct Depot Maintenance costs are the labor, materials, and transportation for

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

PATRIOT PAC-3, December 31, 1995

18a. (U) Operating and Support Costs (Cont'd):

repair of major FU component parts, and software support. The sustaining investment consists of modification kits and support operations. Other Direct Support costs include maintenance civilian labor, and other direct support for mod kit installation. The Indirect Costs are for indirect support operations, Military Occupational Specialty (MOS) training costs, Quarters Maintenance and Utilities, Post Production Engineering, Central Supply, Unit Operations, Base Operations, and training activities. PAC-3 is an upgrade program to the fielded PATRIOT system, therefore, O&S costs remain unchanged. There is no antecedent system.

b. (U) Costs -- (FY 1988 Constant (Base-Year) Dollars in Millions)

| Cost Element             | Avg Annual Cost Per<br>Patriot PAC-3<br>Fire Unit | Avg Annual Cost Per<br>Antecedent System<br>N/A |

(b)(1)

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

Each of the component subsystems in the AN/SQQ-89 were separately developed as independent programs during the late 1970's and early 1980's. Each subsystem was separately approved for full production (AFP). In April 1983 the Navy chartered PMS411 to assume responsibility for developing and producing surface ship ASW systems. The AN/SQS-53C was the last subsystem to be developed, achieving Initial Operational Capability in FY91. Initially each subsystem was produced under a separate contract and the system was integrated on board ship. In FY88 General Electric Company (GE) was selected to be the first prime contractor to manufacture integrated AN/SQQ-89 systems while technology was transferred to a follower to support dual-source competition start-up in FY90. GE was awarded the FY88-89 contract on a sole source basis as the incumbent manufacturer of most of the subsystems. Based upon responses from

~~CONFIDENTIAL~~

AN/SQQ-89 ASWCS, December 31, 1995

## 7a. (U) Program Highlights (Cont'd):

contractor teams led by Westinghouse Electric Corporation (WEC) and Raytheon, the Navy competitively selected the WEC team to compete against the GE team for AN/SQQ-89 production. While GE was the first to produce integrated AN/SQQ-89s, WEC won the first production competition in FY90 and subsequently the FY92-95 production lots.

The FY90, FY91 and FY92 Appropriation Acts directed that the AN/SQQ-89 be redesigned to incorporate a new display, (now known as AN/UYQ-65), based on the Advanced Video Processor (AVP). In FY90, FY91 and FY92, Congress directed the redesign of AN/SQQ-89 to incorporate the AN/UYQ-2 Enhanced Modular Signal Processor (EMSP).

The AN/SQY-1 program was terminated in November 1991. Funds for the Surface ASW Systems Improvement program were transferred to the AN/SQQ-89 ASWCS SAR beginning in December 1991.

In FY94 Congress directed the Navy to use commercial emulators in place of Mil-Spec display equipment. AN/SQQ-89 FY94 through FY96 AN/UYQ-21 display requirements will be met by refurbishing existing shore-based AN/UYQ-21s and upgrading their configuration for shipboard use. The AN/UYQ-70 commercial display work station will be used starting with the last AN/SQQ-89 in FY96.

All full-up production AN/SQQ-89 and AN/SRQ-4 systems beyond FY95 will be procured exclusively with SCN funds for the DDG Flight IIA. This will be addressed as part of the DDG 51 SAR. After FY92, OPN funds cover system backfit modifications and improvements which will continue to be reported in the AN/SQQ-89 SAR.

In an effort to reduce initial procurement, upgrade cost, and life cycle logistic costs, the Navy is incrementally converting the AN/SQQ-89(V) architecture to a modular system based on industry standard commercial "off the shelf" (COTS) hardware and software. Starting with our FY96 buy, most of the remaining Mil-Spec units that have COTS equivalents are being replaced.

## b. (U) Significant Developments Since Last Report --

The AN/SRQ-4 solicitation for FY95 to FY99 production requirements was issued 2 May 1995 under full and open competition. The incumbent, Lucas Aul, was not eligible to compete due to their debarment.

On 17 May 1995, WEC asked the U.S. District Court for a temporary restraining order and subsequent injunction directing the Navy to cancel the competitive procurement for FY96-00 AN/SQQ-89 requirements. On 30 June 1995, the Court ruled that competitive procurement could proceed. The competitive solicitation was

\*\*\* UNCLASSIFIED \*\*\*

AN/SQQ-89 ASWCS, December 31, 1995

## 7b. (U) Program Highlights (Cont'd):

released in August 1995, and proposals were received from Westinghouse and Lockheed-Martin.

On 10 August 1995, WEC reaffirmed its intent to submit a claim for as much as \$170 million in damages if the Navy issued a competitive RFP for FY96-00 AN/SQQ-89 requirements. They stated their claim would be based upon performing the FY92-95 production contract in the belief that they would receive subsequent AN/SQQ-89 contracts on a sole source basis. WEC continues to meet all requirements on the FY92-95 contract and has not submitted a claim.

In an effort to provide the latest technology to the fleet, OPNAV has directed that Engineering Change (EC) 16 be procured and installed on board CGs 47-55 with OPN funds. This EC kit will upgrade the existing AN/SQS-53A active sonar to an AN/SQS-53D which will provide a significant performance improvement. Installation of the EC-16 Kits on board CGs 47-53 will give these systems a recognized variant, the AN/SQQ-89(V)11. Installation on board CGs 54 and 55 will upgrade the SCN AN/SQQ-89(V)2 to an AN/SQQ-89(V)11.

This system will satisfy mission requirements.

## c. (U) Changes Since As Of Date --

The Firm Fixed Price (FFP) AN/SRQ-4 Production Contract, N00024-96-C-6395, was awarded to Frequency Engineering Laboratories on 30 January 1996. The basic contract is valued at \$6.4M.

The FFP AN/SQQ-89(V) Production Contract, N00024-96-C-6300, was awarded to Lockheed Martin Integrated Systems on 27 February 1996. The FY96 basic contract is valued at \$65.0M.

The Cost Plus Award Fee AN/SQQ-89(V) Design Agent and Technical Services Contract, N00024-96-C-6301, was awarded to Lockheed Martin Integrated Systems on 27 February 1996. The basic contract is valued at \$36.2M.

Captain Richard E. Goldsby assumed command of the AN/SQQ-89 Surface Ship ASW Program, PMS411, on 20 February 1996 replacing Captain Gerald K. Nifontoff.

## 8. (U) Threshold Breaches:

There are no breaches to the approved Acquisition Program Baseline, dated 10 May 91. There are no Nunn-McCurdy unit cost breaches.

(U) The "Demonstrated Performance" data are currently being reviewed via Revision 4 to TEMP 802-2 to reflect recent average fleet performance. Subsequently, the "Current Estimate" data will be updated as appropriate.

(b)(1)

b. (U) Previous Change Explanations --

Demonstrated performances of the AN/SQR-19 subsystem Figure of Merit (FOM) and Array MTBF have been revised to accurately show performance demonstrated subsequent to TECHEVAL/OPEVAL. The current estimates in Streaming and Recovery Time and Array MTTR have been revised to accurately show performance being achieved.

Operational performance thresholds for the AN/SQQ-89 system have been identified in TEMP 802-2.

### b. (U) Previous Change Explanations --

#### RDT&E

Economic: Revised escalation indices.  
 Schedule: Program restructured due to funding constraints.  
 Engineering: System redesigned to use new Navy standard hardware.  
 Estimating: Increased contractor support costs, hardware development and integration costs. Transfer of funds from the AN/SQY-1 program. Extension of program through FY01.

#### Procurement

Economic: Revised escalation indices.  
 Quantity: Decreased ship market.

## 13b. (U) Cost Variance Analysis (Cont'd):

Schedule: Revised ship installation schedule with reduction in procurement rate.  
Engineering: System redesigned to use new Navy standard hardware.  
Estimating: Contract savings, reduction of unallocated budget and rescope of lab effort. Current and prior inflation offset.  
Support: Change in procurement requirements and contract savings. Decrease in spares and other support due to funding constraints.

### MILCON

Support: PMA266 transfer of AN/SQQ-28 and AN/SRQ-4 MILCON funding for the construction of operations and maintenance facilities in Mayport, Florida and North Island, San Diego, California.

### O & M

Economic: Revised escalation indices.  
Estimating: Refinement of estimate to include two additional program years for AN/SRQ-4 and AN/SQQ-28 programs.  
Support: O&M,N funding has been transferred to OPN FMP.

### Explanation of Change: None.

This contract consists of a definitized \$19.1M cost-plus incentive fee (CPIF) development effort and a \$65.0M firm-fixed price (FFP) procurement portion. The development portion is complete, and the production portion is expected to be definitized in April, 1996. We will be purchasing 138 production systems and have purchased 3 development systems for a total of 141 under this contract. (Note: The quantity of 83 shown in Initial Contract Price was for the minimum quantity to be purchased. The number was transposed (38) in the prior SAR.) The Statement of Work was restructured to reflect the change to develop an NDI/COTS-based system vice a fully

15. (U) Contract Information (Cont'd):

contractor developed system. This change resulted in more than expected cost savings, and as a result a greater quantity was able to be purchased. In anticipation of a contract overrun, the development portion was modified to restructure the cost overrun ratio from 60/40 to 0/100 (Government/Contractor), and DRS was relieved of the requirement for cost and schedule reporting.

16. (U) Program Funding Summary (Current Estimate in Millions of Dollars):

There are 91 funded OPN AN/SQQ-89(V) systems which include 11 OPN configuration variants. The last full OPN system was procured in FY92 and installed in FY95. Each system will receive several incremental upgrades as part of the continuing program. Each system is counted at the time that its major OPN-funded upgrade is procured. OPN funding from FY93-03 is for upgrades and high priority performance improvements. Funding levels beyond FY03 are unknown and will be included as part of the POM 00 process.

17. (U) Production Rate Data:

a. (U) Deliveries to Date --

|             |                    |
|-------------|--------------------|
|             | <u>Plan/Actual</u> |
| RDT&E       | 0/0                |
| Procurement | 81/81              |

The AN/SQQ-89 ship systems are counted as being delivered at completion of installation and checkout. Trainers and shore sites are counted when they are delivered to the site. Additionally, trainers and shore sites are only included in the count if they are fleet operational systems. There are 24 delivered SCN systems, and 57 delivered OPN systems. The delivery quantity includes those OPN and SCN systems which completed installation and checkout prior to December 31, 1995.

b. (U) Approved Design-to-Cost Objective -- N/A.

AN/SQQ-89 ASWCS, December 31, 1995

## 18a. (U) Operating and Support Costs (Cont'd):

### a. (U) Assumptions and Ground Rules --

1. There is no antecedent system.
2. O&S costs for the AN/SQQ-89 are based upon 75 AN/SQQ-89 systems.
3. OPN O&S costs are for ECPs to the system and procurement of spares.
4. MPN O&S costs are for personnel required to operate and support the shipboard system.
5. O&M,N O&S costs are for laboratory and program office support in-service systems, field services, and equipment and software maintenance.

### b. (U) Costs -- (FY 1985 Constant (Base-Year) Dollars in Millions)

| Cost Element | Avg Annual Cost Per system | Avg Annual Cost Per N/A |
|--------------|----------------------------|-------------------------|
| O&M,N        | 1.2                        | N/A                     |
| OPN          | 0.3                        | N/A                     |
| MPN          | 0.7                        | N/A                     |
| Total        | 2.2                        | N/A                     |

### c. (U) Contractor Support Costs -- (Current (Then-Year) Dollars in Millions)

| Funding | FY1995 & Prior | FY1996 | FY1997 | Balance To Complete | Total |
|---------|----------------|--------|--------|---------------------|-------|
| O&M,N   | 35.3           | 3.0    | 3.0    | 18.0                | 59.3  |
| Total   | 35.3           | 3.0    | 3.0    | 18.0                | 59.3  |

c. (U) Changes Since As Of Date --  
The Block IIIA and the Tomahawk modification for the UK Tomahawks  
contracts were awarded on 31 January 1996.

- 5 -

~~\*\*\* SECRET \*\*\*~~

TOMAHAWK (R/UGM-109), December 31, 1995

8. (U) Threshold Breaches:

There is currently a schedule breach to the SAE approved Acquisition Program Baseline (APB) dated 16 September 1994, in the Tomahawk Baseline Improvement Program (TBIP) schedule. Dates were adjusted to reflect a 15 month program delay due to impacts from TSSAM program cancellation and budget reductions. A Program Deviation Report has been submitted. A new Acquisition Program Baseline will be submitted for approval as soon as the total impact has been ascertained. There are no Nunn-McCurdy unit cost breaches.

9. (U) Schedule:

TOMAHAWK

b. (U) Previous Change Explanations --

Conventional Dispenser Variant OPEVAL completion was delayed from 7/87 to 5/88 due to ship availability and delay in missile delivery due to hardware availability. OPEVAL delays led to the NPDM delay from 12/87 to 8/88. IOC delays for Block IIB were caused by OPEVAL testing difficulties. IOC Block III AUR changed from March 1993 to April 1993 due to ship installation schedules. IOC for APS changed from August 1993 to September 1993 due to Ada and COTS software problems. Land Attack Conventional Block III AUR changed from Apr 93 to reflect actual date of accomplishment.

c. (U) Current Change Explanations -- None.

(b)(1)

b. (U) Previous Change Explanations --

Changes for Terminal Accuracy, Mission Reliability, Dispense Reliability and Mission Success are based on the aggregate results of on-going flight test demonstration and storage data of weapons systems. These changes were incorporated in the NAE approved Acquisition Program Baseline dated 12 Feb 92. Range Operational, TLAM/D, UGM-109D, Block III changed from N/A to TBD. Changes for Mission Reliability - TLAM-N/RGM/UGM-109A, TLAM-C/RGM-109C, UGM-109C; TLAM-D/RGM-109D/UGM-109D; TASM/UGM-109B; and Mission Success - TASM/RGM-109B; TLAM-D/UGM-109D, RGM-109D are results of incorporating the latest flight test and storage data through December 1994. Wave Height (Sea State) changed from N/A to actual value.

c. (U) Current Change Explanations --

(Ch-1) Updated to reflect ABP objectives. Currently scheduled for OTL-199 in FY97.

(Ch-2) Changes are all based on results of latest flight test and storage data through December 1995.

b. (U) Previous Change Explanations --

RD&E

Economic: Revised economic escalation indices. Economic adjustment for negative program change.

Quantity: Reduction of 7 missiles.

Schedule: Program delay to make design improvements, increase commonality, accelerate development of conventional land attack missile variant, and realign development of nuclear land attack. Theater Mission Planning Center IOC slip from FY90 to late FY91.

Engineering: Design changes for commonality with the Ground Launch Cruise Missile. Complete Tomahawk baseline

\*\*\* UNCLASSIFIED \*\*\*

TOMAHAWK (R/UGM-109), December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

TOMAHAWK

program including BGM-109C. Implementation of program restructuring including additions such as Submunition Dispenser, Terminal Maneuver, Improved Booster, Nuclear Safety, specific Weapon System block upgrades, Theater Mission Planning Center Upgrades. Block IIIB Overrun. Program years add-on. Revised Integrated Strike Planning System Requirement. Congressional increase for engine. Hard Target Penetrator.

Estimating: Revised estimate to offset economic indices. Addition of Theater Mission Planning System development caused by program restructuring. Adjustment for current/prior inflation and travel (pro-rata share). Congressional Adjustment for TMPC and DBOF rate reduction. TMPCU/APS TSCM enhancements and SBIR.

Support: To fund the first surface ship fire control system trainer from RDT&E.

Procurement

Economic: Revised economic escalation indices. Economic adjustment for negative program change.

Quantity: Reduction of fire control systems for 33 ships and 52 submarines. Establish Procurement objective of 3994 missiles. Quantity change of 36 missiles. Deletion of 400 missiles in FY94 from total program. Addition of 200 missiles to the program. Addition of 278 missiles in FY92 as Desert Storm replacements and deletion of 60 nuclear missiles in FY92. Variance resulting from increase of 520 units from 4048 to 4568.

Schedule: Delay first procurement from FY80 and FY81. Rephasing of 689 missiles from FY85-87 to FY88-92 and the Congressionally mandated rephasing of FY84 TASH's. Missile procurement schedule slip for affordability issues. Accelerate procurement of 400 missiles from FY93 into FY91/92. Rephase procurement of 564 missiles from FY91/FY92 into FY93-FY95. Realignment associated with Quantity changes in FY91 and FY92. Changes in procurement buy schedule.

Engineering: Requirements to use Armored Boxed Launcher vice cannister launchers and production of 1,157 R/UGM-109D variants, vice R/UGM-109C versions. Remanufacturing program to Upgrade to Block III. Production incorporation of the -402 engine. Integrated Strike Planning system Costs for new

TOMAHAWK (R/UGM-109), December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

TOMAHAWK

program requirements. Engineering variance resulting from quantity allocation.

Estimating: Congressionally mandated amortization of tooling and test equipment. Re-estimate of Quality Assurance requirements. Inclusion of both Systems Engineering/Integrating Agent and Principal Support Laboratory in FY85 and later years. Lower costs due to competition. Estimating reductions related to competitive contract awards and repricing. Expected multi-year contract savings. Revised estimates of surface and submarine support equipment. FY89 competition savings. Reclassification of costs as inflation. Additional Non-recurring to support program stretch (FY93-FY97). New program year FY95/96/97 add-on for Weapon Control System Alts/Mods; Surface and Submarine System Engineering/Integrating Agents and special support equipment. DD1415 Reprogramming for Hurricane Hugo. Adjustments for miscellaneous non-technical items such as Defense Business Operations Fund relating to affordability issues. Additional 130 capsule launch systems. Theater Mission Planning Center Support reestimate. Afloat Planning System costs associated with new program requirements. Costs associated with additional Weapon Control System. Deferral of installation costs. Navy Below-Threshold-Reprogrammings related to affordability issues. Revised estimates of surface support costs. Reestimation of FY91 and FY92 requirements required by Quantity and Schedule changes. Adjustment for current/prior inflation and pricing (pro-rata share). ILS Integrator savings. Installation Annualization. Transfer Warfare/Eng Centers. Economic procurement/Mods reprogramming, DBOF pricing and rate reduction, BSO realignment. Correction to align flyaway and support costs. Deletion of modification end item.

Support: Support equipment and initial spares associated with missile quantity changes. Schedule rephasing of associated missile support equipment, spares and Common Weapon Control System (CWCS) spares. Transfer of Theater Mission Planning Center (TMPC) support requirements from missile flyaway. Deletion of one AN/SWG-3. Reduction for initial spares. Peculiar Support equipment reestimate. Initial spares reestimate to support increased

TOMAHAWK (R/UGM-109), December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):  
TOMAHAWK

quantity and rephased procurement. Revised fleet support and spares requirements. Adjustment for current and prior inflation. Correction to align flyaway and support costs.

MILCON

Economic: Revised economic escalation indices.  
Estimating: Economic Adjustment. Additional missile magazines. Revised project estimates. Adjustment for current and prior inflation.  
Support: Revised project estimates.

18. (U) Operating and Support Costs:  
TOMAHAWK

a. (U) Assumptions and Ground Rules --

The Operating and Support costs are based on annual averages derived from a thirteen year period from FY89 through FY01.

The operational concept is a "Wooden round" which does not undergo maintenance except at the depot level. This maintenance cycle is

\*\*\* UNCLASSIFIED \*\*\*

TOMAHAWK (R/UGM-109), December 31, 1995

18a. (U) Operating and Support Costs (Cont'd):

TOMAHAWK

known as a recertification and includes examination and replacement of time limited components. The recertifications peak at an average 355 per year in FY99 through FY01.

An operational flight test program is conducted to determine operational readiness and aging effects of the deployed weapons system and to provide fleet training. Operational flight tests are currently scheduled at the rate of eight per year.

The software support activity includes hardware and software maintenance for the operational flight system, the weapons fire control system, and independent validation and verification of the software.

Technical and Operations costs include life cycle management training, Naval Weapons station operations, integrated logistics support, and contractor engineering technical services.

Theater Mission Planning provides for the programming of Tomahawk missions and maintenance of hardware and software systems.

Platform maintenance is included for Tomahawk launch platforms at an approximate level of 134 platforms per year.

There is no antecedent system.

TOMAHAWK TBIP

a. (U) Assumptions and Ground Rules --

TBIP, as currently planned, will not increase the O&S costs of the Tomahawk system because there will be no net increase to inventory. TBIP assets will be remanufactured from older, existing Tomahawk missiles. There will be some decrease in Depot Maintenance costs because TBIP will have a ten year recertification interval. As currently planned, the first TBIP recertification would not occur

UH-60L BLACK HAWK, December 31, 1995

**6. Mission and Description:**

The BLACK HAWK is a twin engine helicopter that is used in the performance of the air assault, air cavalry, and aeromedical evacuation mission. This aircraft is sized as an infantry squad assault helicopter, capable of carrying up to 14 troops, but normally configured for a crew of 3 and 11 troops. It performs the missions of transporting troops and equipment into combat, resupplying the troops while in combat, and performing the associated functions of aeromedical evacuation, repositioning of reserves, and command and control. The UH-60L BLACK HAWK is continuing to replace the UH-1H Iroquois in air assault, air cavalry, and aeromedical evacuation units.

**7. Program Highlights:**

**a. Significant Historical Developments --**

On June 22, 1971 the BLACK HAWK program was approved by the DEPSECDEF for full-scale development. On March 6, 1972 a contract to develop a 1500 shaft horsepower advanced technology engine was awarded to General Electric Company (GE). August 30, 1972 contracts were awarded to Boeing Vertol and Sikorsky Aircraft to develop the BLACK HAWK airframe. Prototype qualification testing commenced October 17, 1974 and was completed December 8, 1976. These tests accumulated 2,990 flight test hours and 2,676 ground vehicle test hours. The BLACK HAWK was approved for production as a result of Defense Systems Acquisition Review Council (DSARC) III, held on November 30, 1976. On December 23, 1976, Sikorsky Aircraft and GE were awarded initial production contracts for airframes and engines, respectively. October 22, 1979--Army Systems Acquisition Review Council (ASARC) IIIA was held, at which time permission was granted for follow-on BLACK HAWK production.

May 15, 1979--FY80 HASC report 96-166 directed the Army to perform a UH-60A HELLFIRE feasibility demonstration. The demonstration was integrated with Army requirements for the UH-60A BLACK HAWK to carry external stores, such as fuel tanks, to meet self deployment and extended range needs--the External Stores Support System (ESSS) program. May 20, 1982--the HELLFIRE feasibility demonstration was satisfactorily completed. July 1, 1983--Development Testing II (DT II) of the ESSS was successfully completed. September 23, 1983--Operational Test II (OT II) was successfully completed at Ft. Campbell, KY. The DOD FY84 Authorization and Appropriation Acts directed the Army to qualify the HELLFIRE missile system on the UH-60A, and appropriated \$15M to fund the program. Congress appropriated an additional \$15.8M in the DOD FY86 Appropriation Act to complete qualification of the HELLFIRE missile system on the UH-60A. DT II for the UH-60A HELLFIRE Missile System was completed in November, 1987. The HELLFIRE system is qualified on the UH-60A and a Technical Data Package (TDP) has been procured for any future UH-60A HELLFIRE system procurement requirements.

\*\*\* UNCLASSIFIED \*\*\*

UH-60L BLACK HAWK, December 31, 1995

7a. Program Highlights (Cont'd):

The multiyear III airframe contract for FY88-91 to procure 252 UH-60s was fully executed with an additional 36 UH-60Ls procured in FY91, bringing the total contract quantity procured to 288 UH-60's.

Congressional interest and subsequent funding in FY88 initiated an Army effort to develop an upgrade to the UH-60A, to include a composite rotor system, designated as the Multi-Stage Improvement Program (MSIP). Development of the MSIP was scheduled to conclude in 1992, with incorporation of the changes on the production line (no retrofit of the fielded fleet was planned). After development contracts had been negotiated, however, the program was terminated due to insufficient resources in the outyear procurement program.

The procurement objective for the UH-60 was increased from 1,107 to 2,253 in February, 1989, as stated in the Army Aviation Modernization Plan. The propulsion system for the UH-60 was changed from the T700-GE-700 to the T700-GE-701C in October, 1989, as the result of a competitive procurement of an engine with increased horsepower. With the incorporation of the T701C engine into the UH-60, the aircraft model designation was changed to the UH-60L. The significant improvement in performance of the UH-60L over the UH-60A eliminated all Material Need deficiencies except for the requirement for mission endurance.

An FY92-96 airframe multiyear contract for an additional 300 UH-60L aircraft was awarded in April, 1992. Congress split funding for the FY93 quantity of 60 aircraft between the Army (52 aircraft) and the National Guard (8 aircraft). Deliveries on this contract will conclude in June of 1997.

A new medical configuration was proposed to improve the medical care capability of the UH-60L. The new series was designated as the UH-60Q, and a program to modify a UH-60A to the UH-60Q configuration began during FY92 (Proof of Principle) utilizing UH-60 production funds.

b. Significant Developments Since Last Report --

Following the Congressional appropriation of \$70M of FY96 Advance Procurement funds for a follow on multiyear, the Army added funding to procure 172 aircraft on an FY97-01 multiyear contract. This will bring the total UH-60s procured (including 980 UH-60As) to 1,622--420 short of the total requirement.

The BLACK HAWK system is expected to satisfy the mission requirements.

Notes:

The UH-60L is a derivative of the UH-60A. Approval for production incorporation was granted by a DA IPR for type classification.

Vertical Rate of Climb (VROC) in FPM is predicated on using 95% of Intermediate Rated Power (IRP).

Cruise Speed in Knots is based on using Maximum Continuous Power (MCP).

Endurance in Hours is based on using a mission profile.

Maintenance Man-hours per Flight Hour (MMH/FH) include inspection and servicing, total corrective MMH/FH, through Aviation Intermediate Maintenance (AVIM) level.

10a. Performance Characteristics (Cont'd):

The requirement for Air Transportability on a C-130 was approved for deletion from the program (TWX, DAMO-RQD, June 8, 1978).

Mission reliability is currently being measured in terms of Meantime Between Mission Aborts (MTBMA) in hours. The value shown is equivalent to the value for probability of success.

b. Previous Change Explanations -- None.

c. Current Change Explanations -- None.

b. Previous Change Explanations --

Procurement

Economic: Revised escalation indices.

Quantity: Quantity increase from 127 to 470.

Schedule: Impact of stretching out, contracting, and adding skip years to the production schedule.

Engineering: More stringent requirements for protection against the electromagnetic environment (EME).

Estimating: Higher than anticipated cost for the airframe and engine, procurement of a large number of mission flexibility kits, and addition of costs for production shutdown.

Support: Stretch of production schedule; addition of requirements for flight simulators, PMO and matrix

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

UH-60L BLACK HAWK, December 31, 1995

13b. Cost Variance Analysis (Cont'd):

support cost, and fielding; increased requirements for trainers; reduction in requirements for data, PGSE, and initial spares.

MILCON

Engineering: Revised number of flight simulator facilities allocated to the UH-60L BLACK HAWK.

Estimating: Revised cost of flight simulator facilities.

An airframe DTC goal of \$600K (FY72C\$) was established at Milestone II for the UH-60. A system DTC goal of \$951K (FY72C\$) was established between Milestone II and Milestone III. In neither case, however, were thresholds established. A type classification IPR for the UH-60L was held in September, 1989 without the establishment of a DTC goal or threshold.

18. Operating and Support Costs:

a. Assumptions and Ground Rules --

UH-60L cost estimates are based on a flying hour rate of 18.2 hours per aircraft per month, with aircraft deployed in three representative units--a Combat Aviation Company, an Air Cavalry Troop(Air Cavalry Squadron), and a Medical Evacuation Company. Personnel cost includes the Pay and Allowances and Permanent Change of Station (MPA appropriation) for crew, maintenance, and support personnel attributable to the UH-60A/L BLACK HAWK in the aforementioned units. Consumption includes the cost of replenishment spares and repair parts, war reserve spares and repair parts, and petroleum, oil, and lubricants(POL). Depot maintenance includes the cost of labor, material, and transportation associated with the end item as well as component repair programs. Material modifications reflect the estimated hardware cost of aircraft changes installed after fielding. Other direct costs include the cost of civilian maintenance on the flight simulators, as well as the application of modifications with OLR teams. Other indirect costs include the cost of replacement training for military personnel, as well as the cost of quarters, maintenance, and utilities. The source of the O&S estimate is the Baseline Cost Estimate (BCE) dated July 1991. Assumptions and ground rules for the UH-1 (antecedent system) are the same as for the UH-60, except for a flying hour rate of 20 hours per aircraft per month and that the flight simulator maintenance as well as modification application are completed by military personnel.

CVN-68 Class, December 31, 1995

5. (U) Related Programs: None.

6. (U) Mission and Description:

Nuclear Aircraft Carriers (CVN 68 CLASS) support and operate aircraft to engage in attacks on targets afloat and ashore which threaten our use of the sea and to engage in sustained operations in support of other forces. These ships have two nuclear reactors and nuclear fuel for at least 20 years of normal carrier operations, the equivalent of 11 million barrels of propulsion fuel oil. Speeds of over 30 knots were achieved during NIMITZ (CVN 68) trials. The ship's overall length is 1,092 feet with an extreme breadth of 252 feet. Combat load displacement is approximately 97,000 tons. The flight deck area is about 4.5 acres. The ship has four propellers, four aircraft elevators, and four catapults. The CVN 68 Class will meet all its mission requirements.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

Construction of the CVN 68 Class aircraft carriers began in October 1967 with the start of the NIMITZ (CVN 68). To date six ships have been delivered. The USS NIMITZ (CVN 68), USS DWIGHT D. EISENHOWER (CVN 69), USS CARL VINSON (CVN 70), USS THEODORE ROOSEVELT (CVN 71), USS ABRAHAM LINCOLN (CVN 72), USS GEORGE WASHINGTON (CVN 73), and USS JOHN C. STENNIS (CVN 74) were delivered in 1975, 1977, 1982, 1986, 1989, 1992 and 1995 respectively. There are two ships currently under construction at Newport News Shipbuilding the HARRY S. TRUMAN (CVN 75) and the RONALD REAGAN (CVN 76). CVN 75 construction began in April 1989 and the keel was laid on 29 November 1993. Contract delivery date is June 1998. CVN 76 is scheduled for delivery in December 2002.

b. (U) Significant Developments Since Last Report -- None.

c. (U) Changes Since As Of Date --

There have been no changes since the "as of" date.

8. (U) Threshold Breaches:

The CVN 77 Acquisition Program Baseline (ABP) Procurement Cost dated June 25, 1993 has been breached. The breach was partially due to a increase in base year cost to offset decreased inflation indices. Also, the shipbuilding cost estimate increased due to a production break, an accelerated delivery date, and decreased shipyard manning. A Program Deviation Report and a Baseline Change Request will be submitted. There are no Nunn-McCurdy unit cost breaches.

b. (U) Previous Change Explanations --

CVN-74/75 dates reflect schedule IAW contract award on 6/30/88. CVN 74 actual start production date was October 1988 vice November 1988. CVN 74 keel laying was shifted from December 1990 to March 1991 at the request of the shipbuilder. CVN 75 actual start production date was changed from November 1989 to April 1989. The CVN 75 keel laying date was changed to November 1993 (from August 1992) and CVN 75 launching to September 1996 (from December 1995). This was made as a result of lessons learned on the CVN 72/73 and will result in improved construction efficiency. The contract delivery date of 30 June 1998 will not be affected. The CVN 74 launch date was changed from December 1993 to November 1993 to make it concurrent with the CVN 75 keel laying where the shipbuilder laid the keel of CVN 75 in the same drydock after the CVN 74 was launched.

c. (U) Current Change Explanations --

(Ch-1) The CVN 74 delivered 9 November 1995 vice December 1995.

d. (U) References --

(U) Production Estimate:  
FY 1988 President's Budget

(U) Approved Program:  
NAE Approved Acquisition Program Baseline dated October 02, 1992.

|   | PdE  | Approved<br>Program<br>Objective/Threshold | Demon-<br>strated<br>Perf | Current<br>Estimate |
|---|------|--|---------------------------|---------------------|
| Operational Number of<br>Aircraft (deck<br>multiple in A4<br>Equivalents) | 151  | 151 / 151                                  | 151 3/                    | 151                 |
| Core Life (yrs)   | 13   | N/A / N/A                                  | -- 2/                     | 20                  |
| Number of Reactors  | 2    | N/A / N/A                                  | 2                         | 2                   |
| Crew (Including Air<br>Wing)  | 6280 | N/A / N/A                                  | 6040                      | 6048                |

1/ Actual based on CVN 68 Class standardization trials.

2/ Requires extensive operational data and is dependent on actual core life. The USS NIMITZ, the first CVN 68 class ship, was delivered in 1975 and will not be refueled until 1998.

3/ The operational number of aircraft (deck multiple) in A7 equivalents is 156.

b. (U) Previous Change Explanations --

CVN 74/75 projected crew size at delivery was reduced from 6,280 to 6,048 to reflect 122 accommodations which have been converted to training spaces and 110 accommodations were deleted to accommodate the Versatile Avionics System Test (VAST) equipment. The draft was changed from 38.4 to 38.9 and the displacement was changed from 96,300 to 97,337 to reflect re-evaluated torpedo side protection requirements. This re-evaluation permits an increase in draft and displacement limits while still obtaining the same torpedo side protection capability. Based on demonstrated performance on CVN-68 the core life was increased from 15 years to 20 years.

c. (U) Current Change Explanations -- None.

b. (U) Previous Change Explanations --

CVN 76 projected crew size at delivery was reduced from 6,280 to 6,048 to reflect 122 accommodations which have been converted to training spaces and 110 accommodations were deleted to accommodate

~~CONFIDENTIAL~~

10b. (U) Performance Characteristics (Cont'd):

CVN-76

the Versatile Avionics System Test (VAST) equipment. The draft was changed from 38.4 to 38.9 and the displacement was changed from 96,300 to 97,337 to reflect re-evaluated torpedo side protection requirements. This re-evaluation permits an increase in draft and displacement limits while still obtaining the same torpedo side protection capability. Based on demonstrated performance on CVN-68 the core life was increased from 15 years to 20 years.

c. (U) Current Change Explanations -- None.

d. (U) References --

(U) Production Estimate:  
The FY 1992 President's Budget.

(U) Approved Program:  
NAE Approved Acquisition Program Baseline dated October 02, 1992.

1/ Actual based on CVN 68 Class standardization trials.

2/ Requires extensive operational data and is dependent on actual core life. The USS NIMITZ, the first CVN 68 class ship, was delivered in 1975 and will not be refueled until 1998.

3/ The operational number of aircraft (deck multiple) in A7 equivalents is 156.

15. (U) Contract Information (Cont'd):

|   | Cost Variance | Schedule Variance |
|---|---------------|-------------------|
| Previous Cumulative Variances           | \$-125.6      | \$-57.7           |
| Cumulative Variances To Date (12/31/95) | \$-77.7       | \$-48.5           |
| Net Change                              | \$47.9        | \$9.2             |

Explanation of Change:

The negative cost variance has steadily improved over the past year primarily due to favorable labor performance as NNS continues to use an improved build strategy resulting in a reduction in manhours. Material cost variance for the contract remains steady due to material being greater than 97% committed.

The negative schedule variance improved from last year primarily due to the delivery of CVN 74 on 9 November 1995. Material schedule variance has also continued to improve as NNS continues to payoff the back log of payments on large procurement items.

|   | Cost Variance | Schedule Variance |
|---|---------------|-------------------|
| Previous Cumulative Variances           | N/A           | N/A               |
| Cumulative Variances To Date (11/16/95) | \$1.0         | \$12.9            |
| Net Change                              | \$1.0         | \$12.9            |

Explanation of Change:

The positive cost variance is due to a favorable Overhead rate variance.

The positive schedule variance is a result of progress payments on Ships Service Turbine Generator (SSTG) sets occurring earlier than planned.

Nuclear Detonation (NUDET) Detection System (NDS); Space Boosters Program (Delta II); Medium Launch Vehicle III (MLVIII); Evolved Expendable Launch Vehicle (EELV); and Combat Survivor/Evader Locator (CSKL).

6. (U) Mission and Description:

The NAVSTAR Global Positioning System (GPS) is a space-based radio positioning, navigation, and time distribution system. The GPS provides precise, continuous, all-weather, common-grid positioning, velocity, navigation, and time reference capability to multiple users worldwide. Mission areas supported include navigation and position fixing, air interdiction, close air support, special operations, strategic attack, counterair and aerospace defense, theater and tactical command, control, communications, and intelligence and ground/sea warfare. GPS carries a suite of nuclear detonation detection system sensors as a secondary payload. These sensors provide worldwide, near realtime, 3-dimensional location of nuclear detonations. NAVSTAR GPS does not replace any United States Air Force weapon system; however, it provides the capability to replace the following support systems: Very High Frequency (VHF) Omnidirectional Range (VOR), Long Range Aid to Navigation (LORAN), OMEGA, Tactical Air Navigation (TACAN), and Distance Measurement Equipment (DME).

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

Full scale development of the Global Positioning System (GPS) began in June 1979, with approval of Milestone II. Between this date and October 1985, the Joint Program Office (JPO) launched 10 Block I development satellites and developed the associated ground control system software to support system testing. In May 1983, the JPO

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

NAVSTAR GPS, December 31, 1995

7a. (U) Program Highlights (Cont'd):

awarded a firm-fixed-price, multiyear contract for 28 Block II satellites, and they completed qualification testing in May 1986. The JPO successfully launched the first production satellite in February 1989, and they have since completed an additional 23 successful launches. In June 1989, the Department of Defense (DoD) added 21 replenishment satellites (Block IIR) to the approved program. The JPO completed development of Block IIR in September 1993, and first delivery is expected in August 1996. Initial operational capability (IOC) was declared on 8 December 1993 in a joint announcement by the DoD and Department of Transportation (DoT).

Air Force Space Command (AFSPC) assumed management responsibility for the ground control segment in April 1990. This segment consists of ground antennas, monitor stations, and a master control station necessary to control GPS satellites. The JPO delivered the final release of operational control software for the current production satellite (Block IIA) to the AFSPC in May 1993.

GPS user equipment development began in June 1979 with receiver testing (using Block I satellites) in a variety of land, sea, and air vehicles. Following a competitive source selection, the JPO awarded the first major user equipment contract in April 1985. This contract included research and development as well as production options for 1-, 2-, and 5-channel GPS airborne, shipboard, and manpack (portable) receivers. The JPO received approval for low rate initial production for user equipment in June 1986, and it subsequently awarded the first production option in August 1986. In October 1987, the JPO awarded two second-source contracts for 2- and 5-channel airborne and shipboard receivers. In September 1990, the JPO awarded five production contracts for standard GPS user equipment. Since then, they have awarded additional contracts for the Miniaturized Airborne GPS Receiver (MAGR), the Small Lightweight GPS Receiver (SLGR), the Timing GPS Receiver (TGR), and the Precision Lightweight GPS Receiver (PLGR). The TGR and PLGR were nondevelopmental items (NDI). GPS user equipment successfully completed the Defense Acquisition Board (DAB) Milestone IIIB in January 1992 and achieved depot IOC in March 1993.

To expedite GPS platform installations, Congress mandated, in November 1993, that all military vehicles must have GPS hardware installed by 30 September 2000. The Air Force implemented and funded Project 2000 to meet this requirement.

In October 1992, the NAVSTAR GPS program transferred from a Program Executive Officer for Space to a Designated Acquisition Commander Program. In addition, the Defense Acquisition Executive

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

NAVSTAR GPS, December 31, 1995

7a. (U) Program Highlights (Cont'd):

redesignated GPS from an Acquisition Category 1D to a 1C program.

b. (U) Significant Developments Since Last Report --

On 27 April 1995, Air Force Space Command (AFSPC) declared full operational capability (FOC) of the Global Positioning System (GPS) with the commissioning of 24 operational Block II/IIA satellites and the successful completion of operational testing.

The GPS Operational Control Segment support contract was awarded on 21 July 1995 which consolidated the efforts of six existing contracts into one. This acquisition combined software/hardware development, maintenance, and modification work into a single contract.

On 29 September 1995, a request for proposal was released for Block IIF. Three offerors submitted proposals in early December 1995 and contract award is planned for late April 1996. The acquisition strategy for Block IIF is to now procure 33 satellites. Previously, the strategy was to procure 51 satellites, but it was changed by senior Department of Defense (DoD) leadership to prevent limitations on future competition.

In October 1995, AFSPC approved the launch of Mission II-25 (Block IIA) for 27 March 1996. This will leave three Block IIA satellites in ground storage awaiting future launch calls.

Toward the end of calendar year (CY) 95, work began on the Tri-Service User Equipment (UE) Acquisition Strategy Panel (ASP) Integrated Product Team (IPT). The UE ASP IPT was chartered to develop a comprehensive plan that looked at progress towards the fiscal (FY) 2000 Congressional mandate to integrate GPS, emerging technologies, and dual use of GPS military and civilian communities.

A midterm briefing occurred in November 1995 to the Service Acquisition Executives (SAEs). This briefing highlighted the IPT's methodology and was well received. A final briefing was presented in February 1996.

In CY95, work began on the Navigation Warfare (NAVNAR) Advanced Concept Technology Demonstration (ACTD). The ACTD objectives included: 1) formulating a Concept of Operations for joint forces using GPS in an electronic warfare environment; 2) developing, fielding, and demonstrating new protection and operational employment (prevention) capabilities for airborne and ground-based platforms; and 3) providing the basis for a program to implement these new capabilities into DoD and Allied forces.

With direction from the Office of the Secretary of Defense (OSD), the Joint Program Office (JPO) also began to create a comprehensive

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

NAVSTAR GPS, December 31, 1995

7b. (U) Program Highlights (Cont'd):

acquisition plan to meet navigation warfare protection and denial requirements which complements the NAVWAR ACTD efforts. An initial program management plan and cost estimates were provided to Air Staff and OSD for review. A final briefing to the Under Secretary of Defense for Acquisition and Technology (USD (A&T)) was presented in February 1996.

The NAVSTAR GPS program is expected to satisfy all mission requirements.

c. (U) Changes Since As Of Date --

In January 1996, development began on the Global Positioning System (GPS) Operations System Simulator. This simulator provides an off-line training and engineering capability to GPS operations crews increasing system performance and safety. It will simulate the full GPS constellation of mixed Block IIA and IIR satellites.

In February 1996, the Tri-Service User Equipment Acquisition Strategy Panel Integrated Product Team presented a final briefing to the Service Acquisition Executives (SAEs). The SAEs accepted the recommended strategy and endorsed the proposed actions. Additionally, a Navigation Warfare acquisition plan briefing was presented to the Under Secretary of Defense for Acquisition and Technology, and the proposed approach was approved. Efforts are currently underway to implement the acquisition plan.

In February 1996, the Joint Program Office (JPO) announced slips to three Block IIR milestones as a result of Lockheed Martin's declaration that the milestones could not be met due to various qualification and environmental testing issues. First and second contract deliveries slipped from April 1996 and June 1996 to August 1996 and November 1996, respectively. First launch availability slipped from August 1996 to January 1997. As a result we will breach three Block IIR schedule milestones.

8. (U) Threshold Breaches:

We will breach the three Block IIR schedule milestones in the Air Force Acquisition Executive (AFAE) approved Acquisition Program Baseline (APB) dated 15 September 1994. A program deviation report and baseline change request will be submitted in late March 1996. There are no cost breaches to the AFAE APB and no Munn-McCurdy unit cost breaches.

| Last Block IIA Satellite Delivery                       | N/A                     | NOV 92              | MAY 93              |
| 21 Satellites on-orbit                                  | N/A                     | MAR 93              | JUN 93              |
| First Block IIR Contract Delivery                       | N/A                     | NOV 95              | AUG 96 (Ch-1)       |
| Second Block IIR Contract Delivery                      | N/A                     | FEB 96              | NOV 96 (Ch-1)       |
| Availability of First Block IIR<br>Satellite for Launch | N/A                     | MAR 96              | JAN 97 (Ch-1)       |

b. (U) Previous Change Explanations --

Launch of the first Block II production satellite slipped from January 1987 to January 1989 due to the shuttle stand down. Subsequently, the Air Staff revised the program management directive to incorporate the stand down. An additional delay in the Delta II initial launch capability resulted in the slip in first production satellite launch date from January 1989 to February 1989. Air Force Space Command (AFSPC) accepted turnover of the Global Positioning System (GPS) satellite control segment in April 1990. Twenty-one satellites on-orbit moved from March 1993 to June 1993. The final Block IIA satellite delivery changed from November 1992 to May 1993.

In January 1995, three Block IIR satellite milestones were slipped due to technical problems and delivery delays. First and second Block IIR contract deliveries slipped from November 1995 and February 1996 to April 1996 and June 1996, respectively. Additionally, availability of first Block IIR satellite for launch slipped from March 1996 to August 1996.

c. (U) Current Change Explanations --

(Ch-1) In February 1996, three Block IIR milestones were slipped due to technical problems delaying deliveries. The delivery delays are due primarily to cesium clock qualification failures and electromagnetic interference problems. A modification is underway to replace the cesium clock with a rubidium clock. A redesign and resolution of the electromagnetic interference is expected by May 1996. First and second Block IIR contract deliveries slipped from April 1996 and June 1996 to August 1996 and November 1996, respectively. Availability of first Block IIR satellite for launch slipped from August 1996 to January 1997.

| Full Depot Capability                  | N/A                     | JUN 97              | JUN 97              |

Full Depot Capability: Full Operational Capability (FOC) of initial standardized equipment depot capability occurred at Warner Robins Air Logistics Center in July 1994 and Tobyhanna Army Depot in September 1994. FOC for remaining user equipment is expected in June 1997.

b. (U) Previous Change Explanations --

Due to reliability and maintainability problems identified during user equipment testing, the program office conducted additional testing, causing the delay in completion of user equipment development testing. Delay of the first Block II satellite launch, late user equipment deliveries, and increased coordination required at the conclusion of testing caused the delay in Milestone IIIB from March 1989 to September 1990. In September 1990, the need to conduct additional testing to verify that all exit criteria were met, again delayed the Milestone IIIB decision. These delays caused the slip in the first full-rate user equipment production delivery date. The slip in Milestone IIIB, from September 1991 to January

9b. (U) Schedule (Cont'd):

NAVSTAR GPS User Equip

1992, again caused a slip in the first full-rate user equipment production deliveries from April 1993 to November 1993. Late delivery of an engineering change proposal for depot automatic test equipment caused the slip in depot capability from September 1992 to March 1993. The Joint Program Office added the full depot capability milestone in 1992.

NAVSTAR GPS, December 31, 1995

10a. (U) Performance Characteristics (Cont'd):

NAVSTAR GPS Satellite

- (U) A/ Current demonstrated performance reflects Block II only.
- (U) B/ Requirement is 98% probability of 21 satellites operational. Demonstrated performance is based upon actual availability of the satellites in the constellation.
- (U) C/ Gamma dose rate parameters listed in the approved program column are derived from the approved system operation requirements documents and technical requirements documents.

b. (U) Previous Change Explanations --

Total dose was changed to N/A because requirements could not be specified by a single number. It was specified by integral fusion and natural spectrums. Space based laser threat, Neutron, and X-Ray fluence were changed to correct previous oversights. Cesium Clock Stability changed as a result of test data from the factory & the United States Navy Observatory. Mean mission duration changed as a result of actual on-orbit experience.

c. (U) Current Change Explanations -- None.

d. (U) References --

(U) Development Estimate:

Decision Coordinating Paper (DCP) #133, Revision B, February 1, 1980.

(U) Approved Program:

AFAP Approved Acquisition Program Baseline dated September 15, 1994.

| Sea (hrs)    | 1.3 | 1.5  | / 1.5 | .77                       | .77                 |

Note: The mean time to repair reflects intermediate-level repair of the sets, not operational-level.

b. (U) Previous Change Explanations --

The initial development estimate was established based on engineering estimates and limited test data from initial prototype user equipment. Reliability and Maintainability objectives and thresholds were updated at Milestone IIIB to represent improvements in equipment technology. Due to large variation in performance between 2- and 5-channel receivers, we separated reliability and maintainability parameters for each receiver type. Changes were made to reflect results of latest Global Positioning System receiver operational testing.

c. (U) Current Change Explanations -- None.

Note: The family of NAVSTAR Global Positioning System user equipment consists of over 25 different end items or line replaceable units (LRU's). These LRU's are grouped into six broad categories: receivers, antenna electronics, antennas, control display units, mounts, and support equipment. A user equipment set consists of one or more of these LRU's, depending upon the host vehicle. All Research Development Test and Evaluation (RDT&E) units are considered fully configured end items.

No LRIP quantity has been approved for this program.

b. (U) Previous Change Explanations --

RDTE

Economic: Revised escalation indices.

Schedule: Increases due to accelerated design/ development of flexible modular interface for tailoring user equipment to host vehicles and incorporation of Block IIR functionality.

Engineering: Increases due to redefinition of the Global Positioning System (GPS) survivability program, and development, testing, and redefinition of requirements for GPS replenishment (Block IIR) satellites.

Estimating: Increases due to adjustments for current and prior

\*\*\* UNCLASSIFIED \*\*\*

13b. (U) Cost Variance Analysis (Cont'd):

NAVSTAR GPS Satellite

year escalation changes; an additional year of support for control and user segments; additional control segment modifications required for interface with Block II space vehicle; increased scope associated with Block IIR development, contract support, and full functionality; realignment of funding from weapons procurement for operations support system and launch critical Block IIR software; funding for sustaining engineering; and development of Block IIF and next generation satellites.

Support: Increases due to additional control segment support required prior to turnover to Air Force Space Command; additional support associated with Block IIR development and testing; additional support due to space shuttle launch delays; and new requirement for a system training simulator.

Procurement

Economic: Revised escalation indices.

Quantity: Increases due to addition of 21 Block IIR satellites, 33 Block IIF satellites, and 52 next generation satellites.

Schedule: Increases due to a one-year delay in start of satellite production and change to an annual buy of four Block IIR satellites per year.

Engineering: Increases due to addition of engineering changes for Block IIR procurement.

Estimating: Increases due to adjustments for prior and current year escalation changes. Decreases due to changing from an annual to a multiyear procurement (MYP) approach for Blocks IIA and IIR; Congressional withdrawal of cancellation ceiling for funding Block IIR MYP; Air Force reprogramming of excess prior year funds and funding for the canceled Block IIR optional satellites to higher priorities; realignment of flyaway and support and deletion of space modifications funding.

Support: Increases due to a one-year program extension; adding Block IIR support through FY16; and realignment of flyaway and support.

MILCOM

Economic: Revised escalation indices.

Estimating: The primary cause of the increase was the difference between the President's Budget and required funding.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised escalation indices.

Schedule: Primary cause of increase was acceleration of host vehicle platform integrations.

Estimating: Adjustments for current and prior year escalation changes. Primary causes of increase included revisions to engineering and test estimates by all services, extension of program through 2008, and additional engineering estimates for development of the Selective Availability/Anti-Spoofing Module (SAASM) and Global Positioning System (GPS) enhancements.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

NAVSTAR GPS, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

NAVSTAR GPS User Equip

Support: Decreases were primarily due to a decrease in Air Force mission support and contractor support estimates.

Procurement

Economic: Revised escalation indices.

Quantity: Major cause of decrease was the switch to a non-developmental item procurement strategy for Global Positioning System (GPS) receivers, resulting in substantially reduced unit cost (more than offsetting increased quantities) as well as an overall reduction in requirements for Precision Lightweight GPS Receiver sets, Miniaturized Airborne GPS Receivers, and high cost aircraft receiver units.

Schedule: Overall increase was due primarily to restructuring and extending procurement schedules to account for new force structure requirements.

Engineering: Decrease was due to a value engineering change proposal.

Estimating: Adjustments for current and prior year escalation. Primary reasons for overall increase included revision of learning curves to reflect new contracts, new labor estimates, revisions to aircraft integration hardware and installation estimates, increases in recurring units costs of sea sets, revised program support costs, and aircraft modification estimates. Decreases were caused primarily by unit cost decreases, lower actual prices for aircraft sets, adjustments for force structure reductions, revised estimates for Line Replaceable Units, and transition to commercial and embedded GPS receivers.

Support: Overall increase to date was due to: updated estimates for depot support, user equipment test, and technical support; adjustments necessary for support of increased quantities including spares, fielding, and data costs; revised estimates to support next-generation GPS requirements; and revised estimates for program support of ground and aircraft sets. Decreases were due primarily to revised requirements for spares and installation kits, support estimates for sea and ground sets, revised estimates for support, and aircraft support.

O & M

Economic: Revised escalation indices.

Quantity: Decrease was due to a reduction in labor estimates due to reduced quantities for the Navy and Marine Corps.

Estimating: Adjustments for current and prior year escalation. Overall increase was due primarily to revised estimate by the Navy and Marine Corps for installation labor, and the addition of Marine Corps and Navy requirements. Primary reasons for decreases were a reduction in funding for training of operations and maintenance personnel and aircraft support.

| \$35.3                 | \$26.4  | 0   | \$35.6                        | \$35.6          |

|   | Cost Variance | Schedule Variance |
|---|---------------|-------------------|
| Previous Cumulative Variances           | \$0.0         | \$0.0             |
| Cumulative Variances To Date (12/22/95) | \$0.5         | \$-0.4            |
| Net Change                              | \$0.5         | \$-0.4            |

Explanation of Change:

Note: This is the first Selected Acquisition Report (SAR) in which this contract appears.

This contract includes effort under four different pricing arrangements: Cost-Plus-Award-Fee (CPAF), Cost-Plus-Fixed-Fee (CPFF), Time and Material (T&M), and Firm-Fixed-Price (FFP). The contractor's Cost Performance Report (CPR) reports on the CPAF and CPFF Contract Line Item Numbers (CLINs) only; therefore the data presented here reflects only the cost reimbursable work. The T&M and FFP CLINs represent another \$2.9M of work. The ceiling price is lower than the target price because it applies only to development of the software required for full functionality of Block IIR and the OCS Re-Architecture development. The target price applies to all CLINs currently reported in the CPR.

The cumulative cost variance is \$+0.5M. This variance is due to time lags in receiving and processing subcontractor billings. This cost variance is masking negative cost variance in System Development which results from the contractor's use of additional resources for System Design Review (SDR) preparation.

The cumulative schedule variance is \$-0.4M. This variance is due to the diversion of resources from planned activities in System Development to the completion of SDR. SDR was originally scheduled to complete in November 1995 and was actually completed in December 1995. There is no impact to the contract or the program as a result of the schedule variance.

The current contract price \$35.3M, which reflects an increase from the original contract price, is due to the addition of four system modifications and the fiscal year (FY) 96 budget for software maintenance and configuration management.

| Cumulative Variances To Date (12/31/95) | \$-31.6       | \$-19.4           |
| Net Change                              | \$-17.0       | \$23.0            |

Explanation of Change:

This firm-fixed-price (FFP) contract requires modified cost performance reporting.

Since the last Selected Acquisition Report (SAR), the cost variance has deteriorated by \$-17.0M due to negative performance in Integration and Test, Parts, and S-Band and W-Sensor. Corresponding cost variances are being experienced in Overhead and General and Administrative (G&A). Integration and Test is experiencing cost variance resulting from increased support being required for the resolution of test anomalies and from the late deliveries of flight components. The Parts variance results from additional support required for unforeseen problems and hardware issues. The S-Band and W-Sensor cost variance is due to rework issues surrounding antenna test failures.

Beginning in February 1995, Lockheed Martin Astro Space (LMAS) replanned all labor and material accounts, substituting completion milestones with interim milestones. This conversion enabled the contractor to claim portions of earned value prior to completion of the task, thereby eliminating a large portion of the incurred to date schedule variance.

The favorable change in the schedule variance (\$+23.0M) since the last SAR is due to the replan and milestones described above, as well as improved performance in the following areas: Payload; Subcontracts; Parts; and Ground Support Equipment. Schedule variance also improved in G&A and Material Handling. Payload is responsible for much of the improved schedule variance (\$+17.0M) due to the deliveries of total navigation payloads (TNPs) one and two and

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

NAVSTAR GPS, December 31, 1995

15. (U) Contract Information (Cont'd):  
partial milestone credit for TNP three.

There is no cost impact to the program as a result of the cost variances. The contract is FFP and the overrun is being absorbed by IMDS. The schedule variance, however, has impacted three milestones. First and second vehicle deliveries slipped from April 1996 and June 1996 to August 1996 and November 1996, respectively. First launch availability slipped from August 1996 to January 1996.

The current contract price increased from \$647.2M to \$663.6M, reflecting the addition of the Operational Support System and recent Economic Price Adjustment. The contractor's estimated price at completion increased by a like amount, but now includes a \$.7M increase to cover an increase in the Cost of Money rate and a \$.5M increase due to a reassessment of the cost to complete for several teams.

\*\*\* UNCLASSIFIED \*\*\*

NAVSTAR GPS, December 31, 1995

18. (U) Operating and Support Costs:  
NAVSTAR GPS Satellite

a. (U) Assumptions and Ground Rules --

Operations and support costs include all costs of operating, maintaining, and supporting the NAVSTAR Global Positioning System (GPS) spacecraft from the dedicated Master Control Station (MCS) located at Falcon Air Force Base (AFB) CO. Also included are the costs for operating, maintaining, and supporting four dedicated GPS Ground Antennas (GAs) (located at Cape Canaveral Air Force Station (AFS) FL, Kwajalein Atoll, the Ascension Islands, and Diego Garcia); and five monitor stations (located at Falcon AFB, Maui, HI, Kwajalein Atoll, the Ascension Islands, and Diego Garcia). Satellite operations at the MCS include mission planning, mission payload operations, and monitoring of satellite state of health. GAs transmit navigation data uploads and commands to the GPS spacecraft and receive telemetry data from the spacecraft. Monitor stations receive mission payload data and transfer this data to the MCS to ensure spacecraft are operating as desired. These costs do not include the unallocated costs associated with the shared use of remote tracking stations which are programmed and borne by the Air Force Satellite Control Network and the Consolidated Space Operations Center program elements.

There is no applicable antecedent program.

b. (U) Costs -- (FY 1979 Constant (Base-Year) Dollars in Millions)

| Cost Element | Avg Annual Cost Per<br>NAVSTAR GPS Sat | Avg Annual Cost Per<br>Antecedent |
|--------------|--|-----------------------------------|
| O&M          | 1.5                                    | N/A                               |

| Total   | 16.7              | ---    | ---    | ---                       | 16.7  |

Note: Costs reflect funds controlled by the System Program Director  
as included in the FY97 President's Budget.

NAVSTAR GPS User Equip

a. (U) Assumptions and Ground Rules --

(1) The operations and support costs are the direct costs to repair, replenish and support the Global Positioning System (GPS) user equipment. The maintenance cost includes the material and labor costs at the organizational and depot levels. The training costs are necessary to maintain the required quantity of maintenance and operations personnel. The software support costs include all costs to provide life cycle software engineering for GPS user equipment. The support equipment support cost includes the cost of all necessary support and maintenance of the GPS user equipment. The sustaining investment costs include the cost of replenishment spares of air, sea, and ground sets, including their respective batteries and support equipment. Costs reflect updates for the fiscal year (FY)97 President's Budget.

There is no applicable antecedent program.

5. (U) Related Programs:

F-15; E-3 AMACS; NATO Airborne Early Warning and Control System; E-2C Hawkeye Carrier-Based Airborne Early Warning Aircraft; E-8 (JSTARS); Tactical Air Operations Module (TAOM); Modular Control Element (MCE); Air Operations Center (AOC); Airborne Battlefield Command and Control Center (ABCCC); Rivet Joint; Air Intelligence Agency; F-14 Tomcat; Aircraft Carrier (CV); Guided Missile Cruiser (CG); Guided Missile Destroyer (DDG); Army Data Distribution System (ADDS); Forward Area Air Defense (FAAD); High and Medium Air Defense (HIMAD); Ballistic Missile Defense Organization (BMDO) Theatre High Altitude Area Defense (THAAD); BMDO CORPS Surface-to-Air Missile (CORPS SAM).

6. (U) Mission and Description:

The Joint Tactical Information Distribution System (JTIDS) Class 2 family of terminals will provide improved combat capability in fighter aircraft, command and control centers, and surface air defense units by providing near real-time, netted, jam-resistant, secure data and voice communications. Real-time, high capacity data transfer between weapons platforms and C3 systems is required for more effective management as the density of the air combat environment increases. The JTIDS Class 2 terminal development is a Joint Service Program with the Air Force as the Lead Service. The family of JTIDS Class 2 terminals consists of the Class 2, the Class 2H (which includes a high power amplifier group, typically for command and control platforms), and the Class 2M (smaller terminal for mobile Army platforms). The United Kingdom (UK) is buying Class 2 terminals for their air defense fighters and ships and both the UK and France are buying Class 2H terminals as part of their E-3 acquisition. The Class 2 terminals use the Tactical Digital Information Link (TADIL-J) (NATO Link 16) message standard. The Class 2 terminal does not replace any existing DOD system.

The JTIDS SAR reflects only the RDT&E program. Production quantities and funding for the individual platforms are included in the budget lines for those specific programs.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

Full Scale Engineering Development (FSED) of the JTIDS Class 2 Time Division Multiple Access (TDMA) terminal for Air Force and Army applications was authorized by DSARC IIA, 13 Jan 81. Singer-Kearfott Division was awarded the FSED contract for Air Force and Army test and evaluation on 14 Jan 81.

A DSARC IIB approved Full-Scale Development (FSD) for the Navy Distributed TDMA (DTDMA) JTIDS terminal in Jan 82. The Secretary of the Navy subsequently directed use of the Air Force-developed Class 2 TDMA terminals for Navy and Marine Corps platforms in Oct 85. Also in 1985, the Army directed development of a reduced-size, data-only terminal, designated the Class 2M, to meet the needs of the Forward Area Air Defense (FAAD)/High and Medium Air Defense (HIMAD) programs.

Development of a high-powered Class 2 terminal, designated the Class 2H, was initiated in March 1986 to meet the needs of the Air Force E-3A. The Modular Control Equipment (MCE), Tactical Air Operations Module (TAOM), E-2 and Ship platforms were later added to the 2H development.

The basic Class 2 terminal completed initial DT&E/IOT&E in Oct 86, with reliability, maintainability and interoperability deficiencies observed. The Multi-Service Initial Operational Assessment (IOA) in Apr 87 judged system performance to be marginal. Successful completion of Phase I Development Test/Operational Assessment (DT/OA) in May 89 verified corrections of DT&E/IOT&E deficiencies. The DAB IIIA in Oct 89 approved Low-Rate Initial Production (LRIP) of Air Force and Navy Class 2 terminals, but also directed reliability improvements. The JPO established a Reliability Development/Growth program in Jan 90 which successfully demonstrated Class 2/2H/2M terminal Mean-Time-Between-Failure (MTBF) thresholds between Nov 90 and Aug 94.

LRIP contracts for 34 LRIP (Lot 1) terminals were awarded to Plessey Electronic Systems Corporation (FSD leader) and Rockwell International Corporation (FSD follower) in Mar 90. An additional 171 LRIP terminals were awarded yearly on Lots 2-5 from Sep 91 to Oct 94. LRIP for the Navy F-14D, E-2C, and Ships was approved by a 12 Mar 91 Navy Program Decision Meeting (NPDM). NPDM meetings in Sep 92 and Aug 93 approved subsequent Navy LRIP Lot buys.

The first two Tri-Service demonstrations were successfully completed in Nov 91. The Navy Operational Test and Evaluation Force (OPTEVFOR) evaluation of Feb-Mar 92 at-sea tests was potentially operationally suitable/effective. The Commander OPTEVFOR report in Jan 93 withdrew the Navy's operational evaluation due to uncorrected

JTIDS, December 31, 1995

7a. (U) Program Highlights (Cont'd):

terminal deficiencies. The JPO coordinated a joint strategy to correct Navy terminal deficiencies and complete Navy testing. The Navy then conducted additional DT/OT events in 1993 to verify terminal readiness for TECHEVAL and OPEVAL, scheduled for 1994.

Three JTIDS Affordability and Manufacturing Technology Demonstration (AMTD) contracts were awarded 30 Jun 93 to prove the feasibility of producing a low-cost JTIDS terminal.

The first operational deployment of a fully integrated JTIDS Class 2 platform occurred in Aug 93 when the Airborne Battlefield Command and Control Center (ABCCC) Program began flying a JTIDS-equipped C-130 to support "Operation Deny Flight" in Bosnia. HQ ACC began a one-year Operational Special Project (OSP) at Mt. Home AFB, ID, with JTIDS-equipped F-15C aircraft in Sep 93 to evaluate data link utility in fighter aircraft.

The Army declared air-ground Initial Operating Capability (IOC) of the Class 2M terminal on 23 Sep 93.

Navy TECHEVAL successfully verified correction of previous terminal integration deficiencies in Mar 94. OPEVAL completed in Aug 94. OPEVAL report released 19 Oct 94 verified that JTIDS was operationally effective/suitable and strongly supported JTIDS fleet introduction. Successful completion of OPEVAL supported the critical exit criterion for the Class 2/2H Milestone III Decision in Feb 95.

The F-15 Fighter Data Link (FDL) Operational Special Project (OSP) Interim Report, per Sep 94 USAFWTC Message, determined that the JTIDS Class 2 F-15 terminal substantially increases fighter effectiveness and acts as a force multiplier.

President's Budget Decision (PBD) removed the Army's production funds in FY95, breaching several Class 2M Acquisition Program Baseline (APB) parameters. The Army and Ballistic Missile Defense Office (BMDO) briefed revised Class 2M requirements to the OSD C3I Committee in Aug 94, allowing the JPO to take the necessary actions to support the Class 2M Low-Rate Initial Production (LRIP) Decision in Feb 95. The Army Class 2M Limited User's Test (LUT) was completed in Nov 94.

Emerging results indicated that the LUT successfully demonstrated operational effectiveness/suitability for the air/ground Class 2M requirement. Successful completion of the LUT supported the Class 2M LRIP Decision.

Air Force Systems Acquisition Review Council (AFSARC) to support a Class 2/2H Milestone III and Class 2M Low-Rate Initial Production (LRIP) Decision successfully completed 1 Feb 95. On 1 Mar 95,

JTIDS, December 31, 1995

7a. (U) Program Highlights (Cont'd):

USD(A&T) approved full-rate production for the Class 2/2M terminal and Low-Rate Initial Production for the Class 2M terminal.

b. (U) Significant Developments Since Last Report --

On 6 Feb 95, the PEO for Space, Communications and Sensors informed the Joint Program Office (JPO) that it is the intent of the Navy to begin to transition from procuring JTIDS terminals to procuring the Multifunctional Information Distribution System (MIDS) terminals in FY99. The Navy is also working to accelerate this date to FY97. This would include approximately 138-185 terminals with an associated estimated cost of \$200M-\$300M from the Navy to the MIDS program. In addition, the Navy has realigned their RDT&E JTIDS funds in FY97-FY00 to the MIDS program.

On 3 Mar 95, the first full-rate production contract share was awarded to GEC-Marconi for \$25.2M for 24 Class 2H E-2C, 4 Class 2 MCE, and 2 Submarine terminals. On 8 Mar 95, the second contract share was awarded to Rockwell Collins for \$18.8M for 19 Class 2H Ship and 1 Class 2 Joint STARS terminals.

Per direction in the OUSD(A&T) Memorandum dated 15 Aug 95, Subject: Multifunctional Information Distribution System (MIDS) Production Transition Acquisition Decision Memorandum (ADM), the MIDS Integrated Product Team (IPT) will competitively acquire reduced function LINK-16 terminals that meet the MIDS architecture standards for F-15 fighters. The Joint Program Office (JPO) is working concurrently with the MIDS IPT and Air Combat Command (ACC) to support this Fighter Data Link effort.

The JPO began providing integration support for the Army Class 2M Patriot and the 390th F-15 squadron at Mountain Home AFB. This resulted in the successful completion of the first JTIDS-equipped F-15 squadron.

On 15 Sep 95, the JPO awarded a contract to meet an urgent CECOM requirement to procure Class 2M spares to support the delivery of Class 2M terminals procured in 1994 for Theatre Area Air Defense (THAAD).

The JTIDS system is expected to satisfy all mission requirements.

This will be the final Selected Acquisition Report (SAR) since the program is more than 90% expended.

c. (U) Changes Since As Of Date --

On 5 Feb 96, the Centralized Software Support Activity (CSSA) Initial Operational Capability occurred. The CSSA is now the primary US

7c. (U) Program Highlights (Cont'd):

Government facility for the investigation of JTIDS software Material Improvement Projects.

8. (U) Threshold Breaches:

There are no breaches to the approved DAE Acquisition Program Baseline (APB) dated 15 March 1995. Nunn-McCurdy Unit Cost Reporting is not applicable since there are no fully-configured end items.

9. (U) Schedule:

a. (U) Milestones --

|   | Development<br><u>Estimate</u> | Approved<br><u>Program</u> | Current<br><u>Estimate</u> |
|---|--------------------------------|----------------------------|----------------------------|
| Program Initiation                      | MAR 76                         | N/A                        | MAR 76                     |

b. (U) Previous Change Explanations --

Actual delivery dates for the first PSD terminals for the Navy was Sep 89 and the Army was Mar 88. Milestone IIIA for the Air Force was delayed one month by the DAB committee to Sep 89. Proposal preparation and funding constraints delayed production contract award to Feb 90. Due to this delay, delivery of the first production unit for the Air Force (F-15) slipped to Apr 92. Full production for the Army Class 2M was delayed until Oct 92 due to program restructuring and Army funding constraints. Milestone IIIB slipped to Oct 93 due to completion of exit criteria to the 11 Oct 89 JTIDS Milestone IIIA ADM. The Army Program was restructured changing Milestone IIIA to Sep 93 and Milestone IIIB to TED. Based on ASD/C3I direction to rebaseline Milestone IIIB to Oct 93,

\*\*\* UNCLASSIFIED \*\*\*

JTIDS, December 31, 1995

9b. (U) Schedule (Cont'd):

full-rate contract award dates slipped for AF E-3, JSTARS and MCE to Feb 94. IOT&E milestones, externally managed platforms, slipped for E-3 to Sep 91, JSTARS to Sep 95 and MCE to Nov 95 due to reasons unrelated to the JTIDS terminal. The 1st FSD terminal for MCE was delivered in Oct 90 vs Jun 90. A revised Acquisition Program Baseline (APB) was signed 10 Jul 91. The Army will now conduct a Milestone III in Oct 93. The E-3 Program Office informed the JPO that E-3 restructured and the IOT&E date slipped from Sep 91 to Dec 91. Milestones were combined to simplify reporting externally managed platforms by class of terminal versus by individual platform. The E-3 IOT&E date slipped from Dec 91 to Feb 92 due to rebaselining of the program. The MCE IOT&E date (Nov 94) was erroneously reported in the Sep 91 SAR. In the Dec 92 SAR, the Navy slipped completion of OPEVAL from Jun 93 to May 94 due to scheduling conflicts with Navy assets and the requirement for additional developmental and operational testing required by OPTEVFOR prior to OPEVAL. The E-3 Program Office informed the JPO that the E-3 IOT&E was completed in Mar 92 vs Feb 92. The Army Class 2M (FAAD) Milestones were "to be determined" as the program was non-executable as currently structured. The first Class 2 terminal was delivered early in Mar 92 vs Apr 92. Milestone IIIB (Now Milestone III) for the Class 2/2H slipped to Feb 95 vs Oct 93 due to the slip in Navy OPEVAL as the Navy OPEVAL is an ADM requirement prior to the Milestone III decision. Full-rate contract award for the Class 2/2H slipped from Feb 94 to Mar 95 due to the Milestone III slip. IOC for the Class 2H slipped from Sep 93 to May 94 due to the revised Carl Vinson Battle Group deployment schedule. In the Dec 93 SAR, the Navy slipped completion of OPEVAL from May 94 to Jul 94 due to scheduling conflicts with Navy assets and the requirement for additional development testing and operational testing required by OPTEVFOR prior to OPEVAL. Joint STARS IOT&E will complete in Nov 95 vs Sep 95 due to test restructuring. MCE IOT&E will complete in Nov - 96 vs Nov 95 due to test restructuring. The Army's Class 2M Forward Area Air Defense program was restructured to reflect the Army's Sep 93 re-validation of the air-ground Class 2M program with funding through Low-Rate Initial Production deliveries and the Ballistic Missile Defense Organization Jul 93 decision to join the Class 2M program. 2M IOT&E and Multi-Service Operational Test (MS-OT-III) in Sep 96 vs TBD; Full-Rate Contract Award in Jun 97 vs TBD; and delivery of the 2M First Production Unit in Jun 99 vs TBD. Full-Rate Contract Award for Class 2/2H was rescheduled for May 95 vs Mar 95. Navy Class 2H Initial Operational Capability (IOC) was rescheduled for Feb 94 vs May 94 due to the revised Carl Vinson Battle Group deployment schedule. Army declared IOC for the Class 2M in Sep 93 vs TBD based on the fielding of Class 2M development units. Navy OPEVAL completed in Aug 94 vs Jul 94 due to scheduling conflicts with Navy assets and the requirement for additional developmental and operational testing required by OPTEVFOR prior to

\*\*\* UNCLASSIFIED \*\*\*

JTIDS, December 31, 1995

9b. (U) Schedule (Cont'd):

OPEVAL. Joint STARS IOT&E was rescheduled for Feb 96 vs Nov 95 due to test restructuring. MCE IOT&E was rescheduled for Apr 97 vs Nov 96 due to test restructuring. Army Class 2M IOT&E and Multi-Service Operational Test (MS-OT-III) was rescheduled for Nov 96 vs Sep 96 due to test restructuring to support Class 2M Milestone III Decision; Full-Rate Contract Award was rescheduled to May 99 vs Jun 97; and delivery of the 2M First Production Unit is May 99 vs Jun 99. Upon approval of a new Acquisition Program Baseline (APB) which will include a Low-Rate Initial Production (LRIP) Decision (Feb 95) and Contract Award for the Army's FAAD Class 2M terminals (Nov 95), the Army will receive their First Production Unit in Nov 97 and EMDO will receive their First Production Unit in May 99. Full-rate Contract Award for the Class 2/2H was rescheduled to Mar 95 vs May 95 to meet Navy requirements.

c. (U) Current Change Explanations --

(Ch-1) The Joint STARS Program Office informed the Joint Program Office (JPO) that the JSTARS IOT&E will be completed in May 96 vs Feb 96 due to test restructuring.

(Ch-2) The 15 Mar 95 DAE approved Acquisition Program Baseline (APB) added these milestones in support of the 1 Mar 95 Class 2/2H Milestone III Decision and the Class 2M Low-Rate Initial Production Decision.

(Ch-3) The Milestone III Decision for the Class 2/2H terminals occurred on 1 Mar 95 vs Feb 95.

(Ch-4) Delivery of 1st Production Unit for the Class 2M is now scheduled for Nov 97 vs May 99 based on Low-Rate Initial Production Decision contract award.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised escalation rates. In 1993, USAF Economic Adjustment for Negative Program Change increased escalation.

Quantity: Air Force quantity increases from 15 to 64 development terminals through 1990 to accommodate new platform testing and integration requirements; Army increase from 5 to 51 development terminals through 1988 for testing and integration; Addition of 26 Navy development terminals to joint program in 1987 with an increase from 26 to 32 terminals in 1990 for new platform integration testing; Addition of 27 OSD funded terminals in 1988.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

JTIDS, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

Addition of 40 development units in 1994 to support Ballistic Missile Defense Organization (BMDO) THAAD and CORPS SAM programs.

Schedule: Increase due to 6 month schedule slip of RDT&E; deletion of Army FY85 test support funds.

Engineering: Increased scope of Software Support Facility, Contractor Software Support, F-15 Avionics Intermediate Shop, sustaining F-16 planning effort, F-15 IOT&E, Class 2 Logistics, F-15 Group A; decreased scope of F-16 and Bilingual Interface; added development of Class 2 terminal High Power Amplifier and interfaces for upgrade in E-3 and MCE platforms to TADIL-J capability; F-15 PSE added to program; addition of Army budget for DT/OT IIA testing. MIDS FSD added to program.

Estimating: Yearly adjustments for current and prior year escalation.

Revised estimates through 1988 for Class 1 work removal; undistributed budget cuts (FY87, FY89); adjustments to correct errors in 31 Dec 83, 31 Dec 84, and 31 Dec 85 SARs; Gramm-Rudman cuts; reinstatement of Army funds managed at OSD; FY 90-94 USAF and Navy estimate increased for follow-on development, testing, and program support and MIDS development and support (USAF); Navy reductions for program restructuring; and increases for platform integration costs not included in early estimates.

In 1989, reduction of FY 90-94 AF and OSD funding; MIDS transferred to Navy.

In 1990, increased estimate for preplanned product improvements; Navy program restructuring impacted FY 87-95; reduction in JTIDS supportability, logistics, interoperability and product improvement due to funding constraints; and additional data link development in FY 95-97.

In 1991, ABCCC integration efforts added; increased Navy estimate for integration in FY 91-94 due to restructuring from fiscal constraints; reduced USAF Preplanned Product Improvements (P3I) effort in FY 91-97 due to fiscal constraints; increased OSD estimate due to revised data link development costs.

\*\*\* UNCLASSIFIED \*\*\*

JTIDS, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

In 1992, increases from extension of the FYDP (FY98-99), adjustments for actuals; Navy increases for fiscal years not previously reported (FY 95-97); USAF increases (FY 76-80) for previously unreported fiscal year budgets resulting from Program Office Budget Review. OSD reductions resulted from Congressional adjustments.

In 1993, negative adjustment for current and prior year inflation; USAF reductions in Pre-Planned Product Improvements and Interim Software Support Activity at Warner-Robins Air Logistics Center due to Budget Reductions; Navy reductions due to program restructuring from Budget Actions; OSD reductions in Class 2M development support due to Budget Reductions.

In 1994, increase due to transfer of Army Data Distribution System (ADDS) JTIDS RDT&E Acquisition Program Baseline (APB) funding to JTIDS APB and SAR; negative adjustment for current and prior year inflation; increase due to USAF and OSD extension of the FYDP; USAF net decreases FY94-99 due to Budget Decisions; increase due to Navy additions for Pre-Planned Product Improvements.

Support: Increased to develop, demonstrate, and evaluate direct link between E-3A and HIMAD elements using Class 2 terminals.

Explanation of Change:

This is a joint Air Force/Army/Navy/Marine Corps contract with Air Force as Lead Service. Changes in Target Price since last report (\$16.2M Increase). Pre-Operational Support and Post-Product Improvement Plan testing \$10.8M; Class 2M Spares Buy \$4.9M; Receiver Synthesizer effort \$0.5M. There is no impact to the contract or the program.

b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

The Class 2/2H and Class 2M Terminal Cost Analysis Requirements Descriptions (CARDS), 11 Jan 95, serve as the technical baseline for this estimate. The costs reported in this section are the costs to operate, maintain, and sustain the JTIDS Class 2/2H and 2M terminals. Costs are based on 464 Class 2/2H and 293 Class 2M terminals installed in 19 platforms: F-15, Air Intelligence Agency (AIA, RC-135), Airborne Command and Control Center, Mobile Operations Center, E-3A (AWACS), E-8 (JSTARS), Marine TACM and ATACC, Navy Ships, Submarines, F-14 and E-2C aircraft, Army FAAD, Patriot, JTACS, THAAD, ATMDTOC, and CORPS SAM. The mission personnel costs includes the cost of pay and allowances for personnel directly assigned to operate and maintain the terminals. Unit level consumption includes the cost of operations, maintenance and support materials consumed at the unit level. This includes replenishment and disposal of battery cells, exchange costs for depot level reparables, and recurring training costs for operators and maintainers. Contractor support includes the costs to repair terminals at a contractor's facility. This category is for both interim contract and contractor logistics support. Sustaining support includes support equipment replacement, depot level sustaining engineering/program management support, and software maintenance activities. Indirect support includes civilian and military labor, material and overhead costs specialty training and base support of JTIDS.

JTIDS, December 31, 1995

18b. (U) Operating and Support Costs (Cont'd):

b. (U) Costs -- (FY 1981 Constant (Base-Year) Dollars in Millions)

| Cost Element           | JTIDS Average Steady State Cost | JTIDS Average Steady State Cost (Antecedent) |
|------------------------|---------------------------------|--|
| Personnel              | 0.0                             | N/A  |
| Unit Level Consumption | 24.5                            | N/A  |
| Sustaining Support     | 9.2                             | N/A  |
| Contractor Support     | 0.3                             | N/A  |
| Indirect Support       | 1.5                             | N/A  |
| Total                  | 35.5                            | N/A  |

In the 1994 SAR, the Operating and Support Costs (O&S) Assumptions and Ground Rules indicated that O&S costs included the Class 2M terminals. However, the 1994 SAR inadvertently excluded O&S costs for the 2M terminal. The O&S costs for the Class 2/2H/2M terminals are included in the 1995 SAR.

c. (U) Contractor Support Costs -- (Current (Then-Year) Dollars in Millions)

TRIDENT II SUBMARINE, December 31, 1995

5. (U) Related Programs:

TRIDENT I Backfit and TRIDENT II (D-5) Missile, TRIDENT I Systems, SSN 21 (SEAWOLF), SSN 688 Class Program and New Attack Submarine (NSSN).

6. (U) Mission and Description:

To provide an undersea strategic missile system to insure that the U.S. continues to maintain a credible, survivable deterrent independent of foreseeable threats. The nuclear-powered OHIO Class D-5 Capable Submarine has 24 missile tubes. Incorporation of state-of-the-art technologies in submarine quietness, mobility, and self-defense make the submarine highly survivable. The submarine can patrol, transit, or evade enemy search forces at higher speeds than previous SSBNs. It has an integrated radio room designed to enhance the survivability of communication links in a hostile electromagnetic environment, and carries the latest submarine defense systems.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

The Deputy Secretary of Defense's Program Decision Memorandum (PDM) of October 2, 1981 directed the Navy to fund development of the TRIDENT II (D-5) missile with a December 1989 IOC. The design characteristics of the TRIDENT II (D-5) missile required modifications to the OHIO Class Submarine. Efforts in FY 1982 included identification of the necessary subsystem changes to incorporate the TRIDENT II (D-5) missile in the OHIO Class Submarine baseline. Required weapon support system and component developments were initiated.

On April 29, 1982, SECNAV maintained the December 1989 IOC for TRIDENT II (D-5), while rephrasing the introduction of the weapon system into the fleet. A decision was made to incorporate the D-5 Strategic Weapon System (SWS) starting with the ninth submarine (SSBN 734). The D-5 capability would be accomplished during initial construction of the ship, consequently the ninth ship delivery was extended one year. The schedules of the tenth (SSBN 735) and the eleventh (SSBN 736) were also extended. The twelfth (SSBN 737) and the subsequent ship construction periods were not affected by the change to TRIDENT II (D-5). On June 1, 1982 the SECDEF advised Congress of the decision to accelerate the rate of introduction of D-5 while maintaining the 1989 IOC.

In November 1982, the Navy executed modifications to the Electric Boat contract which incorporated the D-5 SWS into the SSBN 734 and SSBN 735 and revised their delivery dates to December 1988 and August 1989 respectively. On November 21, 1983 an option to acquire the SSBN 736 was exercised. A contemporaneous modification to incorporate D-5 and extend delivery to April 1990 was also executed. The contract for the SSBN 737 was awarded in August 1985. In

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

TRIDENT II SUBMARINE, December 31, 1995

7a. (U) Program Highlights (Cont'd):

March 1986 an option for the SSBN 738 was awarded. In May 1987 the SSBN 739 was awarded to Electric Boat. In January 1988 the SSBN 740 was competitively awarded to Electric Boat. In October 1988 an option for the SSBN 741 was awarded. In October 1989 an option for the SSBN 742 was awarded. In December 1990 the SSBN 743 (the eighteenth and final SSBN TRIDENT OHIO Class Submarine) was awarded to Electric Boat.

The SSBN 734 delivered in November 1988 and deployed in March 1990. The SSBNs 735 and 736 deployed in October 1990 and in September 1991 respectively. The SSBN 737 was delivered in June 1991 and deployed in June 1992. The SSBN 738 was delivered in June 1992 and deployed in June 1993. The SSBN 739 delivered in June 1993 and deployed in June 1994. The SSBN 740 was delivered in June 1994. The SSBN 741's Ceremonial Launch was conducted in July 1994. Target Delivery Dates were accelerated for SSBNs 742 and 743 from 31 August 1996-1997 to 21 June 1996, and 20 June 1997 respectively, although the Contract Delivery Dates remain the same.

b. (U) Significant Developments Since Last Report --

The USS RHODE ISLAND (SSBN 740) conducted its Post Shakedown Availability (PSA) from February to April 1995 and deployed for its first deterrent Patrol in July 1995. The USS WYOMING (SSBN 742) "Floated Off" in May 1995 and the Ceremonial Launch was conducted in July 1995. The USS MAINE (SSBN 741) was delivered on June 21, 1995 commissioned on July 29, 1995 and completed its Demonstration and Shakedown Operations in December 1995. Electric Boat Division is still projecting accelerated Target Delivery Dates for the two remaining TRIDENTs: USS WYOMING (SSBN 742) and USS LOUISIANA (SSBN 743) from August 31, 1996-1997 to June 21, 1996 and June 20, 1997, respectively.

The Ohio Class D-5 Capable Submarine is expected to satisfy mission requirements.

This is the final SAR based on 90% expenditures.

c. (U) Changes Since As Of Date --

The USS WYOMING Initial Criticality was achieved in January 1996 and will begin Sea Trials in mid-April 1996. The USS MAINE will commence its PSA in late February 1996 and will deploy for its first deterrent patrol during the summer of 1996.

8. (U) Threshold Breaches:

There are no threshold breaches to the Acquisition Program Baseline of December 31, 1988 and no Nunn-McCurdy unit cost breaches.

b. (U) Previous Change Explanations --

The start of construction, launch, acceptance trials, and delivery for the last ship was revised to reflect an increased number of submarines for the total program. Production Estimate included a total program of seven submarines.

The acceptance trials and delivery of the first ship was revised to reflect the completion of those milestones.

The system IOC was revised to reflect delays in the TRIDENT II (D-5) Missile.

The start of construction, launch, acceptance trials, and delivery for the last ship were revised in the December 31, 1990 SAR to reflect a total program of ten submarines vice thirteen in the December 31, 1989 SAR.

Electric Boat decided to accelerate the Target Delivery Dates for the four remaining TRIDENT hulls: from July 1, 1994 to June 24, 1994 for SSBN 740 and from August 31, 1995-1997 for SSBNs 741-743 to June 23, 1995, June 21, 1996, and June 20, 1997 respectively.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised escalation indices.

Estimating: Transfer of certain efforts properly identified with D-5 capable SSBNs from the TRIDENT I program, reallocation of funds to TRIDENT II (D-5) Missile and increased estimates for completion of development efforts. Adjustment for current and prior year inflation. Revised estimates based on latest contract experience.

Procurement

Economic: Revised economic escalation indices. Adjustment for negative program changes.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

TRIDENT II SUBMARINE, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

Quantity: Six additional submarines through December 1989 SAR. Deletion of three submarines in December 1990 SAR.

Estimating: Revised estimates for shipbuilding and GFE costs, estimating changes applicable to deletion of three SSBNs from the program, and correction to sailaway costs in prior SARs. Adjustment for current and prior year escalation. Revised estimates based on latest contract experience.

Support: Correction to reconcile sailaway and support costs in prior SARs. Adjustment for current and prior year escalation. Revised estimates.

MILCON

Economic: Revised escalation indices.

Estimating: Revised construction estimates for Kings Bay.

| (Initial Est) | Econ    | Qty  | Sch | Eng | Est    | Other | Spt   | Total  | (Current Est) |
| 2012.2        | -283.0  | 25.2 | --  | --  | -315.9 | --    | -14.0 | -587.7 | 1424.5        |

For the OHIO Class D-5 Capable Submarine Program, the initial SAR estimate is the Current Baseline Estimate.

15. (U) Contract Information (Then-Year Dollars in Millions):

a. (U) Procurement --

(U) SUBMARINE GROUP VII SHIP:  
 GENERAL DYNAMICS, GROTON, CT  
 N00024-88-C-2000, FPIF  
 Award: January 5, 1988  
 Definitized: January 5, 1988

Initial Contract Price  
Target      Ceiling      Qty

\$1837.9      \$2077.6      3

Current Contract Price  
Target      Ceiling      Qty  
 \$1908.7      \$2158.3      3

Estimated Price At Completion  
Contractor      Program Manager  
 \$1889.8      \$1922.4

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$38.9               | \$21.8                   |
| Cumulative Variances To Date (09/30/95) | <u>\$63.8</u>        | <u>\$-1.2</u>            |
| Net Change                              | \$24.9               | \$-23.0                  |

Explanation of Change:

The net cost and schedule variances are not significant. The Program Manager's estimate at completion remains within the Program Manager's budget.

General Dynamics, Electric Boat Division, previously accelerated the Target Delivery Dates for all three SSBNs in Group VII from August 1994-1996 to late June in their respective years. Electric Boat delivered the first ship of this contract (SSBN 740) on June 24, 1994 and the second ship (SSBN 741) on June 21, 1995. The current Contract Delivery Date for SSBN 742 remains unchanged.

Explanation of Change:

Under Naval Nuclear Program prime contracts about 90 percent of the contract value is subcontracted in fixed price type subcontracts. Because control of prime contract cost and measurement of planned vs. actual cost is exercised through detailed government and prime contractor surveillance of subcontract obligations, the Navy has waived contract cost and schedule control system criteria requirements for Naval Nuclear Propulsion Program procurements. If excess funds are determined to be available, they are returned to the program for further use. Program Manager's estimate at completion remains within approved budget.

TRIDENT II MISSILE, December 31, 1995

5. (U) Related Programs:

TRIDENT Submarine System, TRIDENT I (C-4) Missile Systems, Fleet Ballistic Missile System, and DOE Re-Entry Vehicle Development.

6. (U) Mission and Description:

The TRIDENT II (D-5) Strategic Weapons System program developed an improved Sea Launched Ballistic Missile (SLBM) with greater accuracy and payload capability at equivalent ranges as compared to the TRIDENT I (C-4) system. TRIDENT II enhances U.S. strategic deterrence by providing a survivable sea-based system capable of engaging the full spectrum of potential targets. It enhances the U.S. position in strategic arms negotiation by providing a weapon system with performance and payload flexibility that accommodates various treaty initiatives. TRIDENT II's increased payload allows the deterrent mission to be achieved with fewer submarines.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

In March 1980 the Secretary of Defense described to Congress a Sea Launched Ballistic Missile Modernization Advanced Development Program leading to an end of FY 1983 Defense System Acquisition Review Council Milestone II decision to select a weapon system option which would achieve specific performance objectives with an IOC of CY 1989. The Secretary of Defense reaffirmed the need for an improved Sea Launched Ballistic Missile in his Decision Memorandum of 2 February 1981. The Deputy Secretary of Defense in his Program Decision Memorandum of 2 October 1981, directed the Navy to fund the development of a new higher yield Re-Entry Body for the TRIDENT II (D-5) Missile. The Deputy Secretary of Defense in his memorandum of 28 October 1983, authorized the Navy to proceed to full scale Engineering Development of the TRIDENT II (D-5) SWS and initial production, as necessary, to meet a December 1989 IOC. All major D-5 weapon system subsystem completion development contracts were awarded as of March 1984. The flight testing from the flat pad at Cape Canaveral was completed in January 1989. Fifteen flight tests were fully successful, one flight (the seventh) was a partial success, two flights (the ninth and the thirteenth) failed to meet test objectives, and one flight (the fifteenth) was terminated by the range safety officer and is a "no test." The first TRIDENT II (D-5) Performance Evaluation Missile (PEM) was launched from the SSBN 734 (USS TENNESSEE) on 21 March 1989. The missile experienced loss of control just after first stage (F/S) ignition and was subsequently auto-destructed by the onboard flight termination system (FTS).

The second PEM launched on 2 August 1989 was fully successful. The third PEM was launched on 15 August 1989 and experienced a control loss early in first stage flight, though all hardware that had been modified as a result of the first failure performed satisfactorily.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

TRIDENT II MISSILE, December 31, 1995

7a. (U) Program Highlights (Cont'd):

PEM flight tests resumed in December 1989; six fully successful tests were conducted and the PEM flight test program completed in February 1990.

Effective with the FY 1994 President's Budget, annual missile quantities were reduced from 48 to 24 per year, flight test program requirements were significantly reduced, and the missile procurement objective was reduced to 428 for the outload of ten TRIDENT II submarines vice 779 for eighteen submarines.

The FY 1995 President's Budget further reduced annual missile quantities from 24 per year in FY 1995 and subsequent years to 18 in FY 1995 and 12 per year thereafter. The Navy began looking at ways to preserve the industrial base in a cost-effective manner. Based on revision of several program planning factors, the missile procurement objective was reduced to 389 from 428 for the outload of ten TRIDENT II submarines.

Based on the outcome of the Department of Defense's Nuclear Posture Review the FY 1996 President's budget reflected a TRIDENT II force structure of 14 vice 10 SSBNs. Four Trident I (C-4) configured submarines will be backfit to the TRIDENT II (D-5) configuration beginning in FY 2000. The inventory objective was increased to 434 missiles reflecting the increase in the number of submarines as well as a further reduction in the annual D-5 testing rate from 6 to 4.

The acquisition strategy adopted for the FY 1996 President's budget was based on low rate production augmented by critical component production continuity quantities as required to ensure quality, reliability and safety. This approach minimizes annual funding requirements and minimizes the program risk associated with supplier base instability.

The following TRIDENT II (D-5) submarines have completed strategic loadout and have deployed: the SSBN 734 in March 1990, the SSBN 735 in October 1990, the SSBN 736 in September 1991, the SSBN 737 in June 1992, the SSBN 738 in May 1993 and the SSBN 739 in May 1994.

b. (U) Significant Developments Since Last Report --

The Under Secretary of Defense (Acquisition and Technology) has modified the plan established last year which transitioned the TRIDENT II (D-5) missile program to affordable low rate production. The modified plan reduces the annual procurement of D-5 critical components. This change reduces near term funding requirements but accepts increased risk of supplier-base erosion associated with attempting to achieve affordable production at unprecedented low annual rates.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

TRIDENT II MISSILE, December 31, 1995

7b. (U) Program Highlights (Cont'd):

The USS RHODE ISLAND (SSBN 740) completed strategic loadout and deployed on June 19, 1995. The USS MAINE (SSBN 741) successfully completed two Demonstration and Shakedown Operations (DASO) in September and December of 1995 respectively.

This system will satisfy its mission requirements.

c. (U) Changes Since As Of Date -- None.

8. (U) Threshold Breaches:

There are no threshold breaches to the Acquisition Program Baseline of May 25, 1995 and no Nunn-McCurdy unit cost breaches.

9. (U) Schedule:

a. (U) Milestones --

|   | <u>Production<br/>Estimate</u> | <u>Approved<br/>Program</u> | <u>Current<br/>Estimate</u> |
|---|--------------------------------|-----------------------------|-----------------------------|
| Milestone I (Initiate Concept Definition)   | OCT 77                         | OCT 77                      | OCT 77                      |
| Commence Advanced Dev Phase   | OCT 80                         | OCT 80                      | OCT 80                      |
| Milestone II (Commence FSD)   | OCT 83                         | OCT 83                      | OCT 83                      |
| First Development Flight Test   | JAN 87                         | JAN 87                      | JAN 87                      |
| Milestone III (Production Approval)/<br>Award Initial Missile Production Contract | APR 87                         | APR 87                      | APR 87                      |
| IOC (may be less than full msl outload)   | DEC 89                         | DEC 89                      | MAR 90                      |

b. (U) Previous Change Explanations --

The initial missile production contract was awarded April 8, 1987 (Milestone III A).

The first DASO and the IOC were delayed due to scheduled corrective action for the PEM failures and as a result of destruction of the Hercules Propellant Mix Building #2, used for casting second-stage missile motors. IOC was achieved with full missile outload.

c. (U) Current Change Explanations -- None.

d. (U) References --

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised escalation indices. Adjustment for negative program change.

Quantity: Deleted two development flight test missiles.

Estimating: Reclassification of costs as escalation for current and prior years. Adjustment to prior years and reallocation of funds from TRIDENT II Submarine. Congressional reductions. Revised estimates for incentive payments and based on new contract experience.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

TRIDENT II MISSILE, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

Procurement

Economic: Revised escalation indices. Adjustment for negative program change.

Quantity: Additional 56 missiles required for two additional submarines and subsequent deletion of 443 missiles associated with reduced flight test program requirements and with decision to support a 10-boat TRIDENT II submarine force vice an 18-boat force. While maintaining a 10-boat force, the annual missile quantities have been further reduced resulting in a decrease in the missile inventory objective from 428 to 389. An increase of 45 missiles required to support a 14-boat SSBN force.

Schedule: Deferral of 21 missiles and 20 guidance systems from FY 1990 to FY 2002. Deferral of TRIDENT II (D-5) backfit program. Deferral of 12 missiles from FY 1993/1994 to FY 2004. Program stretch-out from FY 1999 to FY 2000. Change in annual procurement buy due to program stretch-out.

Estimating: Reclassification of costs as escalation for current and prior years and revised estimates based on latest contract experience. Increased costs due to missile production stretch-out. Adjustment made for quantity allocation. Revised estimates due to a change in acquisition strategy.

Support: Reclassification of costs as escalation for current and prior years and revised estimates on support items based on current pricing. Increased support associated with stretch-out of missile production. Deletion of D-5 Backfit outfitting costs at SWFPAC, Bangor. Decreased support due to a reduction of 39 missiles. Increased support costs due to addition of 45 missiles.

MILCON

Economic: Revised escalation indices.

Schedule: Deferral of West Coast D-5 capability.

Estimating: Reclassification of costs as escalation for current and prior years. Revised construction estimates. Deletion of West Coast D-5 capability. Increase associated with D-5 Backfit program. Reduction due to cancellation of FY 1992 A-School relocation.

Explanation of Change:

The cumulative to date cost variance has improved \$14 million. The change is driven primarily by efficiencies at the Joint Venture rocket motor manufacturer. The (\$2.3) million schedule variance is essentially on target when compared to the total allocated budget. This contract includes funding for 18 (D-5) missiles for the United Kingdom.

b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

The Cost Elements are those included for Milestone II providing the Strategic Weapon System (SWS) subsystems' (launcher, fire control, navigation, test instrumentation, missile checkout, missile and guidance) average annual support costs by appropriation through FY 2027. The source of the costs displayed is the Program Manager's estimate as reflected in the FY 1997 President's Budget through FY 2001 and extended through FY 2027. O&S costs and assumptions for the antecedent system TRIDENT I (C-4) have not previously been developed.

DDG 51 DESTROYER, December 31, 1995

5. (U) Related Programs (Cont'd):

AN/SQQ-89, MK-46, MK-50 Torpedo, LAMPS MK-I/MK-III, VERTICAL LAUNCH, VERTICAL LAUNCH ASROC, Armed Helicopter (SH-60), AEGIS Japanese FMS, CEC.

6. (U) Mission and Description:

- The DDG 51 is a multi-mission guided missile destroyer designed to operate offensively and defensively, independently, or as units of Carrier Battle Groups and Surface Action Groups, in support of Underway Replenishment Groups and the Marine Amphibious Task Forces in multi-threat environments that include air, surface, and subsurface threats. These ships will respond to Low Intensity Conflict/Coastal and Littoral Offshore Warfare (LIC/CALOW) scenarios as well as open ocean conflict providing or augmenting power projection and forward presence requirements.

- The DDG 51 Class ships provide outstanding combat capability and survivability characteristics while considering procurement and lifetime support costs. They feature extraordinary seakeeping and low observability characteristics.

- The DDG 51 features the AEGIS Weapon System (AWS), which has quick reaction time, high firepower, and improved Electronic Countermeasures (ECM) capability in Anti-Air Warfare (AAW). The ships' Anti-Submarine Warfare (ASW) System provides superior long range multi-target detection and engagement capability with two embarked LAMPS MK-III helicopters (Flight IIA, DDG 79 and follow). Their Tomahawk, Harpoon, and MK-45 gun weapon systems provide excellent strike and surface warfare capability. The AWS is the heart of an integrated combat system that provides area coverage and command/control focus in all dimensions of Naval Warfighting and Joint Military Operations: AAW; ASW; ASU; Command, Control, Communications & Intelligence (C3I); and Strike Warfare (STW).

- Structural features are an all steel hull and deckhouse with vital spaces protected and located within the hull. The ship employs a gas turbine propulsion system with Controllable Pitch propellers similar to the CG 47 class.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --  
Funding for the lead ship, ARLEIGH BURKE, was provided in FY 1985 with the lead ship construction contract awarded, as the result of full and open competition, to Bath Iron Works (BIW), Bath, Maine in April 1985. The Navy established Ingalls Shipbuilding Incorporated (ISI) as the second source for DDG 51 Class construction by awarding ISI, as the result of full and open competition, the DDG 52 construction contract in May 1987. Milestone IIIA which granted

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

DDG 51 DESTROYER, December 31, 1995

7a. (U) Program Highlights (Cont'd):

limited production approval through FY 1989 was approved in October 1986. Approval for limited production was amended in each subsequent year.

SECDEF's Major Warship Review in 1991 validated the Navy requirement for the ARLEIGH BURKE Class and approved the introduction of Flight upgrades. Flight II was incorporated in the last ship in FY 1992 (DDG 72).

DDG 51 ship custody transfer occurred on 29 April 1991 and was commissioned USS ARLEIGH BURKE on 4 July 1991. The ARLEIGH BURKE deployed with 6th Fleet forces in the Mediterranean. SCN funding for ARLEIGH BURKE completed in February 1993 at a final cost of \$1093M (FY 83\$), \$7M below the \$1100 (FY 83\$) threshold for the lead ship established by SECNAV in February 1983. Ships 6-10 are estimated to be \$121M (FY 83\$) below the \$700M (FY 83\$) SECNAV unit cost threshold.

The Navy, in conjunction with the shipbuilders and prime equipment contractors, has successfully identified and developed affordability and acquisition reform initiatives that have reduced the cost of this class while ensuring critical operational performance is maintained. These cost reductions are reflected in the FY 97 Budget Estimates Submission.

The Office of the Secretary of Defense established the DDG 51 Flight IIA program as an ACAT ID in July 1992. An Acquisition Decision Memorandum (ADM) was signed on 2 February 1994 approving Flight IIA introduction in FY 94 and a continuation of the program at a 3 ship per year profile for a total program of 57 ships. BIW was awarded the first Flight IIA ship, the last ship in FY 94.

The Shock Trial on the USS JOHN PAUL JONES (DDG 53) was successfully completed in June 1994. The ship's performance under shock was outstanding. Warfighting and Full Power capability were maintained or quickly regained after each detonation.

b. (U) Significant Developments Since Last Report --

The Navy is authorized to construct six DDG 51 Class Destroyers in FY 96 and FY 97. These ships will be awarded as a firm/option contracts (two in FY 96 and four in FY 97). In awarding these contracts the Navy will continue the award sequence used during FY 94 and FY 95. FY 96 will contract for three ships, two fully funded ships (DDG 83/84) and one additional ship (DDG 85) using advance procurement funds (\$104M) for production planning and material ordering to accelerate the DDG 85 to an FY 96 production schedule. The balance of funds (\$605M) and an additional three fully funded ships are

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

DDG 51 DESTROYER, December 31, 1995

7b. (U) Program Highlights (Cont'd):

budgeted in FY 97.

In FY 94/95, ASN(RD&A) decided to allocate three DDG 51 Class Destroyers to BIW and three to ISI pursuant to the authority of Title 10 U.S.C. 2304 (c) (3). Simultaneously, the Navy also conducted a study to determine the best approach to procure the remaining 25 ships. Recommendations included: (1) maintain two shipbuilders for the foreseeable future; (2) continue current AEGIS initiatives in value engineering, cost control and cost avoidance; and (3) develop innovative contracting and business practices to incentivize shipbuilders and vendors to reduce costs. The method adopted is the PRO concept (Profit Related to Offer) competition, whereby work is equally allocated between shipyards, but profit levels are competitively determined. These recommendations have been incorporated into the FY 96 Acquisition Plan.

The FY 96/97 Biennial Budget Estimates identified descopes in shipbuilding and GFE lines in FY 94 and FY 95. Funding for these descopes was identified in the 1995 Ship Cost Adjustment. The request for these funds was denied by Congress. Mr. Douglass (ASN(RD&A)) sent letters to the four Congressional committees stating the Navy will submit a reprogramming request to assure that fully capable DDG 51 Class ships are delivered to the Navy by the shipbuilders. Funds need to be in place by October 1996 to allow sufficient procurement lead times to meet ship schedules with no impact to cost.

Total Ship Survivability Tests (TSST) on USS STOUT (DDG 55) and USS LABOON (DDG 58) were completed in the VACAPES OPEREA in 1995. Due to the unique nature of this trial, a dry-run was conducted on DDG 55 to test TSST implementation and data recording procedures. This dry-run TSST was successfully conducted on 7-8 February 1995. Lessons learned from the dry-run were applied to the formal TSST on DDG 58 which was successfully conducted on 28-30 August 1995. A final report on the TSST is available.

Under Secretary of Defense (Acquisition and Technology) redesignated the DDG 51 Destroyer program from an ACAT 1D to an ACAT 1C program.

DDG 51 Class construction has achieved numerous production milestones since the last report. The more significant are:

- DDG 73 (DECATUR) started fabrication 15 January 1995.
- DDG 67 (COLE) launched 10 February 1995.
- DDG 66 (GONZALEZ) launched 18 February 1995.
- USS LABOON (DDG 58) commissioned 18 March 1995.
- DDG 74 (MCFAUL) started fabrication 24 April 1995.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

DDG 51 DESTROYER, December 31, 1995

7b. (U) Program Highlights (Cont'd):

USS RUSSELL (DDG 59) commissioned 20 May 1995.  
USS PAUL HAMILTON (DDG 60) commissioned 27 May 1995.  
DDG 75 (DONALD COOK) started fabrication 18 June 1995.  
USS RAMAGE (DDG 61) commissioned 22 July 1995.  
DDG 69 (MILIUS) launched 1 August 1995.  
DDG 68 (THE SULLIVANS) launched 12 August 1995.  
USS FITZGERALD (DDG 62) commissioned 14 October 1995.  
USS STETHEM (DDG 63) commissioned 21 October 1995.  
DDG 76 (HIGGINS) started fabrication 26 November 1995.  
DDG 65 (BENFOLD) ship custody transfer occurred 4 December 1995.

The DDG 51 program will satisfy mission requirements.

c. (U) Changes Since As Of Date --

DDG 51 Class construction has achieved production milestones since the as of date. The more significant are:

DDG 70 (HOPPER) launched 6 January 1996.  
DDG 64 (CARNEY) ship custody transfer occurred 26 January 1996.

8. (U) Threshold Breaches:

There are breaches to the APB dated 2 June 1995 for the following schedule milestones: Propulsion Engine P3I Initial Ship Installation and Propulsion Engine P3I Engine Support Capability Date. A revised APB will be forwarded upon completion of tests currently scheduled for June 1996.

There are no Nunn-McCurdy unit cost breaches.

b. (U) Previous Change Explanations --

DDG 51 IOC was rescheduled to ensure the ship was completed to Navy standards. The extension to the schedule provided the time necessary for lead ship operational testing.

DDG 52 launch and delivery was adjusted due to the incorporation of helicopter rearming and facilities upgrades, as recommended by Congress. The DDG 53 delivery was rescheduled to permit the shipbuilder to achieve greater production and shipyard efficiency.

The Flight IIA Milestone IV PRG/DAB review, originally scheduled for July 1993 and subsequently rescheduled to October 1993, was approved through an Acquisition Decision Memorandum (ADM) signed on 2 February 1994. Flight IIA contract award was contingent upon issuance of the ADM.

Complete ESSM COEA was adjusted due to the delayed receipt of the Advanced Medium Range Surface to Air Missile (AMRSAM) data to the Center for Naval Analysis (CNA) and difficulties related to modeling the NATO Sea Sparrow Missile System (NSSMS) ship configuration.

\*\*\* UNCLASSIFIED \*\*\*

DDG 51 DESTROYER, December 31, 1995

9b. (U) Schedule (Cont'd):

ESSM Milestone IV date was contingent upon staffing of the Operational Requirements Document (ORD) and completion of the ESSM COEA.

ESSM will be introduced on the first AEGIS Destroyer in the FY 97 program, although earlier planned for introduction on the last FY 96 ship, consistent with AEGIS Combat System Baseline 6, phase II introduction. Funding was not available to incorporate ESSM in FY 96.

c. (U) Current Change Explanations --

The DDG 51 Class schedule adjustments are as follows:

(CH-1)

|  | FROM   | TO     |
|--|--------|--------|
| Propulsion Engine P3I Initial Ship Installation      | Dec 00 | Mar 01 |
| Propulsion Engine P3I Engine Support Capability Date | Dec 05 | Mar 06 |

The Propulsion Engine P3I Initial Ship Installation milestone has been rescheduled for introduction on the last ship in FY 01. The Engine Support Capability Date has been rescheduled to FY 06. These changes are due to budget constraints and engine development. A major re-evaluation of the Propulsion Engine P3I (ICR) will occur after testing in June 1996. A revised Acquisition Program Baseline will be forwarded upon completion of tests.

b. (U) Previous Change Explanations --

Helicopter rearming and facilities upgrades were added to the DDG Class beginning with the DDG 52. Long ton displacement increased to 8315 LT as a result of increasing ship propulsion to 100,000 shaft horsepower.

The FY 94 budget submission requested DDG 51 Flight IIA beginning with the last FY94 ship. Changes from the Flight II ships will be as follows: 1) Addition of Organic LAMPS MK III Helicopter Capability, Dual Helicopter Facility with RAST, 6 VLS Cells, and Affordability Items; 2) Deletion of CIWS (when ESSM available), Harpoon, and TACTAS would be reconstitutable. A revised Acquisition Program Baseline (APB) was approved on 18 March 94 reflecting data for the Flight IIA program.

c. (U) Current Change Explanations -- None.

b. (U) Previous Change Explanations --

RD&E

Economic: Revised escalation indices

Estimating: Revised program funding requirements

Procurement

Economic: Revised escalation indices

Quantity: Addition of 34 ships (FY 1993-2004)

Schedule: Change in acquisition profile (FY 1987-FY 2004)

Engineering: Flight II introduced in FY 92 and Flight IIA introduced on the last ship in FY 94. Also, incorporates Intercooled Recuperative Gas Turbine and Warfighting Upgrades.

Estimating: Revised procurement estimates for ship construction

b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

The O&S estimate projects costs for a 57 ship buy and encompasses the Flight I, II, and IIA designs. The Flight IIA design begins with the last ship in fiscal year 1994. There currently is no planned mid-life capability upgrade for the DDG-51 class over the service life. There are 22 Officers for Flight I, II, and IIA ships. There are 324 Enlisted personnel for Flight I ships, 330 Enlisted for Flight II ships, and 323 Enlisted for Flight IIA ships. The steaming hours are estimated as 4800 hours annually. The average annual cost per ship for Operating and Support costs, over the 40 year projected service life, is estimated at \$39.0M in FY87 dollars.

5. (U) Related Programs:

F-15, F-16, F-22, F/A-18, SEEK EAGLE, North Atlantic Treaty Organisation (NATO) Aircraft (United Kingdom Sea Harrier and German F-4F), Swedish Gripen, NATO European Fighter Management Agency (NEFMA).

6. (U) Mission and Description:

The AMRAAM program provides for the acquisition of the most advanced all-weather, all-environment medium range air-to-air missile system in response to USAF, USN, NATO, and other allied operational requirements for the 1989-2007 time period. The system is an active radar guided intercept missile with inherent Electronic Countermeasures (ECM) capabilities for air-to-air applications against massed penetration aircraft and is designed to augment the AIM-7 Sparrow.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

In January 1979 Defense Systems Acquisition Review Council (DSARC) Milestone I validated the requirement for AMRAAM. In December 1981 the Full-Scale Development (FSD) contract was competitively awarded to Hughes Aircraft Company (Hughes). In July 1982 Raytheon Company (Raytheon) was selected as the follow-on contractor for competitive production of AMRAAM. In September 1982 DSARC Milestone II authorized FSD. In January 1989 Hughes completed flight testing and Raytheon completed second-source qualification testing. The live fire test program successfully ended in August 1989. The Defense Advisory Board (DAB) approved a revised production estimate of \$9.3B (FY84\$). This increase from the original cost cap of \$7.0B breached the Munn-McCurdy thresholds. On April 13, 1990 the USD(A) certified the program to Congress. In May 1990 four AMRAAMs, fired from a single F-15 against four targets, killed their targets. The Missile Rail Launcher (MRL) achieved Initial Operational Capability (IOC) in May 1990. The first F-15 operational squadron was fully equipped with missiles in early December 1990.

AMRAAM (AIM-120), December 31, 1995

7a. (U) Program Highlights (Cont'd):

The FY92 President's Budget reduced the AMRAAM procurement objective from 24,320 to 15,450 and stretched the program one year to FY99 (Lot XIII), resulting in a second Munn-McCurdy unit cost breach. The USD(A) certified the program again to Congress on May 3, 1991. In March 1991 Hughes, with Raytheon as the primary subcontractor, garnered the Preplanned Product Improvement (P3I) Phase 1 contract. In support of Operation Desert Storm, AMRAAM achieved a Mean Time Between Maintenance (MTBM) of 1,300 hours.

On May 23, 1991 the DAB Milestone IIIB authorized the program to continue low rate production through FY92 (Lot VI). AMRAAM IOC on the F-15 occurred September 25, 1991. On January 13, 1992 the first F-16 unit established Full Operational Capability (FOC). A follow-up DAB Program Review, held April 23, 1992, approved full rate production for the FY93 procurement.

In support of the United Nations an AMRAAM downed an Iraqi Air Force MIG under combat conditions in December 1992 and another in January 1993.

The Lot VII contracts, awarded to Hughes Missile System Corporation (HMSC) and Raytheon in February 1993, saw a unit cost decrease of 25 percent. The FY94 Amended President's Budget reduced the procurement objective from 15,450 to 13,038 and stretched the program three years from FY99 to FY02 (Lot XVI). The AF Follow-on Operational Test and Evaluation (FOT&E) Phase 1 program completed in April 1993 and the Navy declared IOC in September 1993.

In January 1994 the Lot VIII missile contracts, awarded to HMSC and Raytheon, reflected a unit cost decrease of 23 percent. The FY95 President's Budget stretched the program three years from FY02 to FY05 (Lot XIX), retaining a procurement objective of 13,038 missiles.

In February 1994 an AMRAAM shot down an aircraft in a combat situation in Bosnia.

Successful completion of the Navy Operational Evaluation occurred in March 1994. In June 1994 Marvin Engineering Company won the Lot VII MRL contract and HMSC received the P3I Phase 2 contract. HMSC obtained, in December 1994, a contract to deliver 1,413 MRLs undelivered by bankrupt United Telecontrol Electronics. The AMRAAM procurement objective decreased from 13,038 to 12,018 and the program was stretched two years from FY05 to FY07 (Lot XXI).

b. (U) Significant Developments Since Last Report --

The U.S. AMRAAM procurement objective decreased from 12,018 to 11,019 and the Foreign Military Sales signed cases have increased to 2,276 missiles. The AMRAAM Lot IX contract was awarded on 7 Mar 95. This marked the fourth consecutive year competitive contracts to HMSC and Raytheon have resulted in lower unit prices. Even though Lot IX procured 200 fewer missiles than Lot VIII, average missile hardware unit cost decreased by 9 percent. The appropriations conference rescinded the remaining \$39.5M of Air Force FY95 procurement funds,

7b. (U) Program Highlights (Cont'd):

which were being withheld by the Office of the Secretary of Defense (Comptroller) because of disagreements over the Joint Service "buy-to-budget" strategy. This equates to a loss of approximately 180 additional missiles for the Air Force.

The program manager proactively chartered an Independent Review Team (IRT) to investigate an apparent trend, because of seven failures of forty-seven missile launches during Feb-Apr 95. The IRT consisted of experts from both services, the prime contractor, and independent consultants. The team found no systemic problems or apparent degradation in missile reliability. The Final F3I Phase 1 flight test was completed in April 1995.

The program office opened the door for a future Tri-Service AMRAAM program by placing AMRAAM on the Hawk launcher to enhance the Army's current Air Defense System. This versatile capability for the AMRAAM was confirmed in the SAFE-Air 95 demonstration held at FT Greely, Alaska where the system scored two direct hits with live warhead shots. This is an example of significant advances in mission capability through the creative use of off-the-shelf systems.

Acquisition reform efforts began in June 1995 with an internal Joint Systems Program Office team established to reshape acquisition strategies. Areas of opportunity were identified and the following streamlining accomplishments were obtained: Restructured organizationally to streamline and reduce overhead; implemented internal reward program for streamlining; consigned and streamlined tasks to Warner Robbins-Air Logistic Center-Integrated Weapon Systems Management; cut man-years in 1994-95; Contract Data Requirements Lists reduced over 50 percent; reduced source selection paper submittal, evaluation team and required data by 50 percent; teamed with Air Force Development Test Center for all program testing; invoked a streamlined 10 year bumper-to-bumper warranty for expected savings of \$67M; and increased contractor guaranteed missile reliability from 450 to 700 hours mean time between failure.

The AMRAAM Production Reliability Acceptance Test program successfully identified a faulty missile component (a potentiometer in the guidance section), which was aggressively worked by the JSPO. Approximately 271 out of 5000 AMRAAMs affected will be retrofitted. The anomaly proved to be transparent to the operations community, as fielded missiles retained their full operational capability and there are no safety of flight issues related to this action. The contractor is repairing these missiles at no cost to the government.

In December 1995, the Warhead Replacement Tactical Telemetry (WRTTM) flight test was successfully completed and deliveries started in January 1996.

On 4 December 1995, the Navy announced its intentions to discontinue efforts to integrate AMRAAM on the F-14D because of F-14D contract cancellations.

AMRAAM (AIM-120), December 31, 1995

7b. (U) Program Highlights (Cont'd):

AMRAAM satisfies all current mission requirements.

c. (U) Changes Since As Of Date --

The Lot X AMRAAM missile award was made on 29 Jan 96. The competitive contracts to HMSC and Raytheon resulted in lower unit prices for the fifth straight year, 4.5 percent this year.

8. (U) Threshold Breaches:

There are no breaches to the approved DAE Acquisition Program Baseline (APB) dated March 18, 1994, and no Nunn-McCurdy unit cost breaches.

9. (U) Schedule:

a. (U) Milestones --

|  | Production<br>Estimate | Approved<br>Program | Current<br>Estimate |

9a. (U) Schedule (Cont'd):

(U) Milestones (Cont'd) --

|               | Production<br>Estimate | Approved<br>Program | Current<br>Estimate |
|---------------|------------------------|---------------------|---------------------|
| Last Delivery | SEP 01                 | N/A                 | NOV 09              |

b. (U) Previous Change Explanations --

AF IOC was delayed from March 1991 to September 1991 because of availability of a fully operational F-15 radar computer tape. DAB IIB slipped from April 1991 to May 1991 due to rescheduling. FOC occurred in January 1992, two months early due to changes in the deployment schedule. Navy OPEVAL slipped from March 1992 to December 1992 and then to August 1993 because of problems with the F/A-18 radar tape. Navy OPEVAL slipped again from August 1993 to March 1994 because of test failures at Point Mugu Test Center, CA and Holloman AFB, NM. AF FOT&E Phase I slipped from March 1992 to February 1993 due to launcher design changes. AF FOT&E slipped from February 1993 to April 1993 because of higher priority test requirements. An administrative change slipped P3I Phase 1 CDR from October 1992 to November 1992 and slipped again to January 1993 because of software design problems. Navy IOC slipped from September 1992 to December 1992 due to launcher design changes. Navy IOC was declared in September 1993 rather than December 1992 because of its dependency upon Navy OPEVAL. The Joint Depot Activation date slipped from September 1994 to January 1998 because of competition for depot development and the relocation of the depot from Alameda NAS, CA to Letterkenny Army Depot, PA. An administrative change moved depot activation from January 1998 to February 1998. The FY94 President's Budget stretched the program three years. The FY95 President's Budget stretched the program an additional three years. This resulted in the last delivery milestone moving from September 2001 to September 2004 and then to November 2007. Last delivery milestone was deleted from the APB in the September 13, 1993 APB and the current estimate is presented for information. P3I Phase 1 Final Flight test completion date slipped from December 1994 to April 1995 due to drone failures and higher priorities in delivering AIM-120B software. Current estimate for last delivery was changed from November 2007 to November 2009 due to a two year schedule stretch.

c. (U) Current Change Explanations --

No changes since December 1994 Selected Acquisition report submission.

(b)(1)

Demonstrated captive carry Mean Time Between Maintenance (MTBM) hours in Production Reliability Acceptance Test (PRAT).

F-Pole - The distance between the shooter and the target when the missile intercepts the target.

A-Pole - The distance between the shooter and the target when the missile goes active.

b. (U) Previous Change Explanations --

Stages I and II of the Captive Carry Reliability Program (CCRP) demonstrated an overall reliability of 90 hours for the eject stations and 203 hours for the pylon stations. The Stage III CCRP demonstrated an MTBM of 118 hours, based on 1764 flying hours. Missile weight increased due to a change in materials. The Pk continues to improve. Availability or operational reliability increased from 93% to 96% because of increase in MTBM. Captive Carry Reliability measured in ACC-conducted tests exceeded 2255 hrs MTBM on the F-16 and exceeded 1333 MTBM on the F-15. Production reliability exceeds 750 hrs MTBM for both Hughes and Raytheon.

c. (U) Current Change Explanations --

No changes since December 1994 Selected Acquisition Report submission.

b. (U) Previous Change Explanations --

RDTE

Economic: Revised economic indices.  
Economic Adjustment for negative program change.

Schedule: Reduced funding in FY94 slipped P3I Phase 2 and 3 schedules.

Engineering: Added funds for ECM updates and lethality improvements.  
Added funds for further P3I technical definition.

Estimating: Adjusted current and prior years inflation.  
Increased funds for PSD contract overruns.  
Reduced P3I Phase 2 funds for propulsion contracts in Navy programs.  
Funded core Navy infrastructures in support of all

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

AMRAAM (AIM-120), December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

P3I efforts.

Delayed contract award for P3I Phase 2 causing Air Force to realign FY94-FY97 funds to FY98.

Increased funds required for the revised P3I Phase 3 roadmap FY98-FY03.

Added new estimate for P3I efforts in FY02-FY07.

Procurement

Economic:

Revised economic escalation indices.

Adjusted for negative program change.

Quantity:

Reduced program from 15,450 to 13,038 units (decrease of 2,412 units).

Reduced program from 13,038 to 12,018 units (decrease of 1,020 units).

Schedule:

Reduced annual procurement profiles in the FY92 budget (extending program one year to FY02), in the FY94 budget (extending the program three years to FY05), and in the FY95 budget (extending the program two years to FY07).

Engineering:

Added non-recurring engineering costs to implement P3I improvements.

Increased funds for the Value Engineering (VE) program and Electronic Safe and Arm Device (ESAD). Reduced the ESAD and AMRAAM Producibility Enhancement Program (APREP) projects.

Estimating:

Adjusted current and prior years inflation.

Added technical support requirements from Raytheon and extended engineering and testing.

Increased contractor overhead rates.

Delayed implementing value engineering changes.

Removed Defense Business Operations Fund.

Decreased estimate to accompany the decrease of 2,412 units.

Increased fixed costs associated with the program stretch to FY05 and allocated contractor fixed costs over reduced quantities.

Adjusted Lots I and II contracts overrun.

Revised estimate based on projecting aggressive Lot VIII competitive prices.

Reduced costs based on changes in FMS quantities.

Revised estimating methodology for production test and re-estimated production support.

Revised P3I implementation estimate due to Lot VIII award.

Reduced special test equipment (STE) and other cost categories in out years due to actuals.

Decreased estimate to accompany the decrease of 1,020 units.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

AMRAAM (AIM-120), December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

Adjusted for prior year actuals.  
 Decreased estimate due to increased FMS quantities.  
 Revised estimate due to Lot VIII competition.  
 Deleted ADA software requirements as a result of  
 cost benefit analysis showing cost as prohibitive.  
 Reduced production support because of reduction on  
 government fixed costs.  
 Decreased P3I implementation due to contract  
 actuals.  
 Increased rate impact caused by decreases in  
 quantity.  
 Support: Added Interim Contractor Support (ICS) previously  
 funded in Operations and Maintenance (O&M).  
 Adjusted current and prior years inflation.  
 Decreased initial spares requirements.  
 Decreased other weapon system requirements.  
 Added spares required for program stretches.  
 Increased Navy PSE and logistics.  
 Added Common Field Level Memory Reprogramming  
 Equipment (CFMRE).  
 Decreased depot and training equipment.  
 Increased spares required for program stretch from  
 FY05 to FY07.  
 Added peculiar support equipment in FY01-FY02 for  
 logistics requirements.

AMRAAM (AIM-120), December 31, 1995

15. (U) Contract Information (Cont'd):

| Current Contract Price |         |     | Estimated Price At Completion |                 |
|------------------------|---------|-----|-------------------------------|-----------------|
| Target                 | Ceiling | Qty | Contractor                    | Program Manager |
| \$103.5                | N/A     | 0   | \$91.9                        | \$98.4          |

|   | Cost Variance | Schedule Variance |
|---|---------------|-------------------|
| Previous Cumulative Variances           | \$0.5         | \$-0.9            |
| Cumulative Variances To Date (01/31/96) | \$0.5         | \$-1.1            |
| Net Change                              | \$0.0         | \$-0.2            |

Explanation of Change:

The net change in current target price from initial contract target price is due to the award of the +5" Rocket Motor contract, period one award fee, and the exercise of options.

The schedule variance is due to delayed test activities, rescheduling of work packages, and technical difficulties.

The Program Manager's estimate at completion assumes a 97 percent efficiency for the remainder of the contract, while the contractor assumes a 109 percent efficiency for the remainder of the contract.

Explanation of Change:

Cost and Schedule variance reporting is not required on this FFP contract.

The net change in current target price from initial contract target price is due to the addition of contract modifications and exercising the Lot VIII option.

Summary does not include funding or quantities for Seek Eagle procurements of 12 AMRAAMs in FY90, 24 AMRAAMs in FY94, and 18 Captive Air Training Missiles (CATMs) in FY95.

The recurring flyaway in FYs 84 - 86 is for 15 missiles in the Raytheon qualification lot and are not considered fully configured end items.

Funding reflects OSD approved inflation indices dated February 28, 1996.

Expenditures and obligations reflect program office records as of March 8, 1996.

17. (U) Production Rate Data:

a. (U) Deliveries to Date --

Dollars in Thousands

Development Estimate reflects a total 24,320 quantity/10 year program at a maximum rate of 250/month. The first three years contained 3640 missiles at a maximum rate of 200/month.

This section requires no update after Milestone III.

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

The AMRAAM will augment the AIM-7 and be integrated and maintained using existing support resources with no additional manpower requirements. The All-Up-Round (AUR) maintenance concept calls for aircraft loading/unloading, removal/replacement of wings and fins and Built-In-Test (BIT) within the missiles. A missile failing BIT will be sent to the Intermediate-Level Shop for test verification on the Missile Bit Test Set (MBTS). For the Navy, the missile will be downloaded/uploaded on a different station or aircraft to verify missile failure. Failed missiles, AF or Navy, will be returned to a Naval Weapons Station (NWS) for failure confirmation and isolation to the failed missile section. Defective sections will be returned to the AMRAAM depot for repair.

The O&S costs are the direct costs for the tactical missile and the Load Trainer/Captive Carry Missile (LT/CCM) associated with operating, supporting, and maintaining the AMRAAM missile over a 20 year deployment phase starting in FY91 for the AF and FY92 for the Navy. The AF estimate covers base operations including Load Trainer/Captive Carry Missile (LT/CCM), AUR fault verification, operational firings, depot repairs (seven year ICS), supply/item management, transportation, replenishment spares, and field software updates. The Navy estimate includes AMRAAM fleet operations and

18a. (U) Operating and Support Costs (Cont'd):

support, intermediate maintenance at NWS, depot rework (five years ICS), technical support (fleet support, engineering services, quality surveillance, program management), supply support, replenishment spares, and contractor augmented support.

The O&S cost estimate was updated December 1995.

There are no antecedent systems; the AMRAAM is designed to augment the AIM-7 Sparrow.

AS AMENDED

96-C-0414

SH-60R, December 31, 1995

6. (U) Mission and Description:

The Multi-Mission Helicopter Upgrade (formally called LAMPS MK III Block II Upgrade) is a development program which brings critical capability improvements to the SH-60B/F helicopters. The capability improvements are essential to future tactical rotary-wing effectiveness in providing battlegroup protection while achieving coastal littoral battlespace dominance. The Block II Upgrade improves the capability of the LAMPS MK III Weapons System to provide battle group protection and adds significant capability in coastal littoral and regional conflicts. The Block II Upgrade entered Engineering and Manufacturing Development (EMD) in FY93 and represents a major avionics modification to the SH-60B, greatly enhancing both primary mission areas of Anti-Submarine Warfare (ASW) and Anti-Surface Warfare (ASuW). The Airborne Low Frequency Sonar (ALFS) will be added to enhance the existing acoustic suite. ASuW effectiveness will be improved with the addition of a multi-mode radar which includes an inverse synthetic aperture imaging radar mode to permit stand-off classification of hostile threats. An improved Electronic Surveillance Measures (ESM) system will enable passive detection and targeting of radar sources not detectable with the current system. Aircrew and aircraft survivability in hostile environments will be significantly improved through software integration of the self-defense equipments. Provisions for a tactical data transfer system to improve platform interoperability by rapid, secure transfer of mission information between multiple air and surface units is included in the upgrade.

The ALFS program develops a low frequency sonar and increased sonobuoy processing capability for the SH-60 helicopter to maintain and improve undersea warfare mission effectiveness against the quiet submarine threat in both deep and shallow water environments. This project provides a dipping sonar with demonstrated deep water capabilities typically 3 to 6 times greater than the current in-service helicopter sonar (square miles of ocean searched per hour). The ALFS system (designated AN/AQS-22) will be installed in the SH-60R aircraft. ALFS provides longer detection ranges and greater detection capability by using lower frequencies, less signal attenuation, longer pulse lengths, improved processing and increased transmission power. This improvement will significantly increase battle group and independent ship protection providing improved survivability and operating flexibility. The ALFS program will utilize the Enhanced Modular Signal Processor (EMSP), designated UYS-2A, as its acoustic processor. The incorporation of enhanced shallow water detection/classification capability, improvements to the acoustic processor, and onboard acoustic performance predictions represent current developments to meet littoral challenges.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

A Tentative Operational Requirement (TOR) for the Block II Upgrade was received in the Naval Air Systems Command (NAVAIRSYSCOM) in May 1986. NAVAIRSYSCOM responded with a Development Options Paper in September of 1986 which listed options for meeting the established requirements and outlined the associated costs. A formal Operational Requirement (OR) for the LAMPS MK III Block II Upgrade was initiated. In April 1987 the Block II OR was revised to include the requirement for dipping sonar. The "Operational Requirements for SH-60B Block II Upgrade" (OR# 209-05-90) was approved in April 1988.

In May of 1988, the RDT&E resource sponsor (OP-03B) was briefed on the upgrade program. The program received approval and commitment for funding support. However, resources available in the FY88 President's Budget were not sufficient to support the Operational Requirement; roughly half of the RDT&E budget required to support development and integration specified in the Operational Requirements.

The OR was again rewritten to respond to the format and requirements of DODINST 5000.2 and include Congressionally directed ESM improvements in 1991. The latest Operational Requirements Document (ORD# 314-03-92) was approved August 3, 1992. The program achieved a MSII decision for entry into EMD in July 1993.

Since December 1990, IBM Federal Sector Division of Owego NY has been under contract to define the air vehicle and mission avionics systems required to meet the Navy's requirements. A structured systems engineering process has been implemented to identify requirements, flow them down into system, subsystem, prime item and critical item specifications, allocate the requirements to hardware and software critical items, perform industry surveys, trade studies, performance analysis, identification of promising technologies, risk identification and mitigation, and cost-benefit analysis of performance criteria. IBM was awarded an EMD contract on August 23, 1993. In addition, IBM has performed competitions for all subsystems whose requirements could not be met by current fielded equipment. IBM Federal Sector Division was subsequently acquired by Loral Federal Systems in March 1994.

An Engineering and Manufacturing (EMD) contract for Airborne Low Frequency Sonar (ALFS) was awarded to the Hughes Aircraft Company in FY91. A system level Critical Design Review (CDR) was completed in FY93 and design verification testing completed at Lake Seneca, NY in FY94. The first two ALFS Engineering Development Models (EDMs) were delivered in FY95, with the system currently in an engineering and manufacturing development phase.

SH-60R, December 31, 1995

7b. (U) Program Highlights (Cont'd):

b. (U) Significant Developments Since Last Report --  
A successful System Level Preliminary Design Review (PDR) was completed in November 1995.  
First two ALFS Engineering Development Units delivered in FY 1995.  
Shallow Water Upgrade (SWUG) enhancements were placed on contract on September 29, 1995.  
Commenced ALFS DTIA testing in November 1995.

This system is expected to satisfy all mission requirements.

c. (U) Changes Since As Of Date --  
The ALFS Test and Evaluation Master Plan (TEMP) was updated and subsequently signed out of COMOPTEVFOR on February 26, 1996.

8. (U) Threshold Breaches:

There are no breaches to the Approved Acquisition Program Baseline dated June 19, 1995.

There are no Num-McCurdy unit cost breaches.

9. (U) Schedule:

a. (U) Milestones --

|                              | Development<br>Estimate | Approved<br>Program | Current<br>Estimate |

SH-60R, December 31, 1995

15. (U) Contract Information (Then-Year Dollars in Millions):

a. (U) EDT&E --  
(U) Development (ALFS):  
 Hughes Aircraft Company, Fullerton, CA  
 N00019-92-C-0001, CPIX  
 Award: December 31, 1991  
 Definitized: December 31, 1991

| Current Contract Price |                |            | Estimated Price At Completion |                        |
|------------------------|----------------|------------|-------------------------------|------------------------|
| <u>Target</u>          | <u>Ceiling</u> | <u>Qty</u> | <u>Contractor</u>             | <u>Program Manager</u> |
| \$53.9                 | \$0.0          | 6          | \$64.6                        | \$65.4                 |

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$-12.6              | \$-2.9                   |
| Cumulative Variances To Date (12/30/95) | \$-15.4              | \$-1.8                   |
| Net Change                              | \$-2.8               | \$1.1                    |

Explanation of Change:

The completion of delinquent system development and test milestones account for the improvement to the unfavorable cumulative schedule variance. The additional cost associated with rework and test delays is the primary reason for the additional cost growth.

(U) Development (Block II):  
 LORAL, Owego, NY  
 N00019-93-C-0196, CPFF  
 Award: August 23, 1993  
 Definitized: December 22, 1994

| Current Contract Price |                |            | Estimated Price At Completion |                        |
|------------------------|----------------|------------|-------------------------------|------------------------|
| <u>Target</u>          | <u>Ceiling</u> | <u>Qty</u> | <u>Contractor</u>             | <u>Program Manager</u> |
| \$266.5                | \$0.0          | 2          | \$274.6                       | \$281.5                |

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$0.0                | \$0.0                    |
| Cumulative Variances To Date (01/31/96) | \$-7.6               | \$-5.5                   |
| Net Change                              | \$-7.6               | \$-5.5                   |

Explanation of Change:

Technical and software productivity issues related to the development of the Integrated Mission Processor (IMP) subsystem, and software and engineering design activities associated with the Radar and Data Display subsystems are the primary drivers behind the unfavorable cumulative cost and schedule variances.

**6. Mission and Description:**

The purpose of the C-17 aircraft is to modernize the airlift fleet and improve the overall capability of the U.S. to rapidly project, reinforce and sustain combat forces worldwide. The aircraft will augment the C-5 and C-141 in intertheater deployment and the C-130 with intratheater operations. Because the C-17 will be capable of carrying outsize cargo over intertheater ranges into austere airfields, it introduces a direct deployment capability that will significantly improve airlift responsiveness. This improved responsiveness will, in turn, dramatically improve the mobility of our general purpose forces.

Significant features of the multi-engine C-17 include: supercritical wing design and winglets to reduce drag and increase fuel efficiency and range; receiver inflight refueling capability to increase range; externally blown flap configuration, direct lift control spoilers and high impact landing gear system, all of which contribute to the aircraft's capability to operate into and out of small austere airfields; forward and upward directed thrust reverser system that provides backup capability, reduces the aircraft ramp space requirements, and minimizes interference of dust and debris on the activities of ground personnel; cargo door, ramp airdrop and cargo restraint systems that are operable by a single loadmaster and permit immediate equipment offload without special handling equipment; two man cockpit with cathode ray tube displays that reduce complexity and improve reliability; maximum use of built-in test features to reduce maintenance and troubleshooting times; and walk-in avionics bays that improve accessibility. The end result is significantly reduced maintenance manhours per flight hour.

**7. Program Highlights:**

**a. Significant Historical Developments --**

A SECDEF decision during the FY81 budget review directed funding for a new aircraft which placed increased emphasis on strategic airlift capability. The initial C-X Program Management Directive (PMD) was issued on 10 Dec 79. The requirements for the C-17 aircraft were formalized by the C-X Mission Element Need Statement, dated 28 Nov 80. In Aug 81, SECAF announced Douglas Aircraft Company (DAC) as the winner of the C-X source selection. (Note: Douglas Aircraft Company-Government Segment was renamed McDonnell Douglas Aerospace-Transport Aircraft (MDA) in Oct 92.)

On 23 Jul 82, the Full Scale Engineering Development (FSED) contract was awarded to DAC. A revised PMD was issued in Jul 83 which directed the continuation of C-17 design effort and the initiation of activities leading to an FSED start by FY85 and a production start by FY88.

In Jan 88, the first competitively-priced production option for two

- 2 -

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

7a. Program Highlights (Cont'd):

aircraft was exercised, along with long lead for the second production option for four aircraft. Assembly start for the first test aircraft occurred at DAC in Long Beach CA, on 24 Aug 88. Milestone IIIA approval was received on 18 Jan 89 for the next two lots of C-17s.

In Sep 90, the C-17 quantity was decreased from 210 to 120 aircraft as a result of a Major Aircraft Review.

On 21 Dec 90, DAC completed the assembly of the test aircraft, a major program milestone and prerequisite for the award of the next production contract. On 15 Sep 91, a successful first flight to Edwards AFB CA initiated the C-17 Flight Test Program.

In 1992, static load and durability testing for full-scale C-17 structural airframes was initiated. A static wing failure during testing in Oct 92, delayed the static test program; however, the final ultimate wing load test condition was successfully completed in Jan 94. Full scale durability testing completed 1.5 lifetime milestone in Nov 94.

On 30 Apr 93, the Under Secretary of Defense for Acquisition convened a special Defense Acquisition Board (DAB) C-17 program review. The Under Secretary assigned action items to be accomplished, including the requirements in the FY93 National Defense Authorization Act and reviews of a Cost and Operation Effectiveness Analysis, the Joint Requirements Oversight Council on requirements, and the Cost Analysis Improvement Group on affordability. A second DAB review concluded on 8 Nov 93 and the Milestone IIIB decision was scheduled for Nov 95. In the interim, the procurement of 40 aircraft was considered an appropriate number to evaluate whether program cost, schedule and performance warrant completing the 120 aircraft buy. An Acquisition Decision Memorandum was issued reducing procurement quantity from 120 to 40 aircraft. The quantity decrease caused the unit cost to increase in excess of the 15% threshold. A Nunn-McCurdy breach was declared in the 31 Dec 93 SAR.

As a result of Defense Science Board recommendations and Nov 93 DAB results, the C-17 System Program Office and MDA implemented a new management plan for the C-17 program under the auspices of an Integrated Master Plan. Integrated Product Development utilized Integrated Product Teams (IPTs). IPTs managed the program and concentrated on achieving three key program goals: (1) Initial Operational Capability (IOC); (2) Reliability, Maintainability and Availability Evaluation; and (3) Milestone III.

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

7a. Program Highlights (Cont'd):

On 6 Jan 94, the settlement agreement resolving claims and program disputes was signed by the Under Secretary of Defense for Acquisition and Technology (USD(A&T)) and MDA. Funding was approved for the settlement in the FY95 Appropriations Act. In Feb 95, contract modifications were signed to execute the settlement agreement.

On 3 Jun 94, the C-17 Globemaster III set its 22nd world record. This record was for short take-off & landing aircraft carrying the greatest payload to an altitude of 2,000 meters.

In Aug 94, initial aircrew ground training for co-pilots and loadmasters transitioned to Altus AFB OK from Charleston AFB SC. A Weapon System Trainer, which included a loadmaster station and a cargo compartment trainer, became operational. A cockpit systems simulator was also installed.

In Aug 94, during a dual-door personnel airdrop test flight, two paratroopers made brief contact during descent. Both troopers landed without injury. However, an Executive Independent Review Team (EIRT), co-chaired by the Air Force and the Army, was chartered to analyze the paratroop entanglement phenomenon. The EIRT determined the C-17 less probable to have an entanglement problem than other platforms (e.g., C-141 and C-5). The team's comprehensive analysis concluded that a combination of revised operational procedures and minor aircraft configuration changes provided a greater margin of separation between descending troopers. Since these changes were implemented, no entanglements have occurred.

On 26 Sep 94, the Under Secretary of the Air Force initiated the C-17 Should Cost Review to consider costs for future C-17 production buys. The Should Cost team's findings had direct impact on reducing unit flyaway costs for follow-on production buys.

A planning DAB was held 2 Nov 94 to review plans for the Nov 95 DAB. A special C-17/Non-Development Airlift Aircraft Program Acquisition Decision Memorandum was issued 16 Nov 94. An updated Acquisition Program Baseline (APB) was signed by USD(A&T) on 10 Nov 94. This APB incorporated the program changes implemented by the 6 Jan 94 settlement agreement and contained updated key performance parameters validated by the Joint Requirements Oversight Council.

On 22 Nov 94, the Program Executive Officer certified the C-17 as ready to begin Dedicated Initial Operational Test and Evaluation (DIOT&E). The decision was made to conduct DIOT&E in phases. Phase I started in Dec 94 to evaluate flight and ground cargo handling characteristics. Phase II began in Jan 95 to execute full flight operations, except for mass static line paratroop airdrop, which was

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

7a. Program Highlights (Cont'd):

reserved for the third phase to be conducted after the EIRT review.

On 16 Dec 94, the development flight test program formally concluded with the completion of over 5,700 total test points. Data analysis and reporting continued through Mar 95. The program began a follow-on development test program to test enhancements and corrective actions to clean up any issues remaining from the Engineering and Manufacturing Development test program. IOC was declared by Air Mobility Command on 17 Jan 95.

The C-17 Globemaster was awarded the Collier Trophy for the top aeronautical achievement of 1994.

b. Significant Developments Since Last Report --

On 10 Feb 95, the President designated the C-17 Globemaster III strategic airlifter program one of the highest national priorities. As a result of this BRICK BAT designation, the program is authorized to use the DX industrial priority rating for contracts and orders placed in support of the program. The program will also benefit from the designation in support of missions and exercises.

The C-17 Defensive Systems Team received the Aviation Week & Space Technology 1994 Laurel Award for outstanding achievement in the field of electronics.

Follow-on Flight test was initiated in May 95 at Edwards AFB CA. Tests performed in the follow-on phase supports producibility enhancements, performance improvements and problem investigations.

On 13 Jul 95, the Producibility Enhancement/Performance Improvement contract was awarded. This contract will be used as the contractual vehicle to mature the aircraft.

The second lifetime of full scale durability testing was completed in Jul 95. A third lifetime of testing began in Oct 95 to extend the planned service life to 45,000 flight hours.

Live Fire testing, designed to assess C-17 survivability against designated threats, was successfully completed in August 1995. The C-17 was found to be survivable in the threat environment for which it was designed.

The Air Force Operational Test and Evaluation Center (AFOTEC) completed data gathering for the Dedicated Initial Operational Test and Evaluation program in Aug 95. AFOTEC rated the C-17 as overall operationally effective and suitable.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

**7b. Program Highlights (Cont'd):**

The C-17 is now conducting operations around the globe. In Aug 95, the C-17 was deployed to Kuwait in Operation Intrinsic Action to support readiness. The C-17 flew relief missions to the Caribbean in the aftermath of Hurricane Marilyn. The short airfield capability of the aircraft proved essential in providing aid to the devastated U.S. Virgin Islands. The C-17 delivered 30% of the tonnage in only 18% of the total airlift missions.

The Lot VII (FY95) production contract was awarded on 12 Sep 95.

On 20 Sep 95, the C-17 Air Force/Industrial Team won the Air Force Association's David C. Schilling Award. The Schilling Award was presented for "the most outstanding achievement in the field of manned flight in the atmosphere or space."

On 1 Nov 95, the Milestone III Defense Acquisition Board directed the Air Force to plan, program and budget for a total of 120 C-17s at the maximum affordable rate and to plan, program and budget for changes necessary to mature the aircraft. Based on a thorough analysis, DoD concluded that the C-17 provided the greatest amount of flexibility to meet the nation's airlift requirements at an affordable price.

Twelve C-17s were deployed to Rhein Main AB, Germany to provide airlift support for the NATO peacekeeping mission in Bosnia. The installation of Airlift Defensive System and Aircrew Armor was accelerated on aircraft supporting the Bosnian deployment. The Globemasters completed over 400 missions, transported over 2,800 passengers and carried 15,000 short tons of cargo. In spite of harsh weather and austere airfield conditions, a departure reliability rate of 97% was recorded.

During the year, the program consistently met its schedule commitments. Quality aircraft continued to deliver ahead of scheduled dates.

This system will satisfy mission requirements.

**c. Changes Since As Of Date --**

The field support contract was awarded on 21 Feb 96; the Lot VIII contract was awarded 23 Feb 96.

On 10 Jan 96, a special Defense Acquisition Board was convened to consider an Air Force proposal for the multiyear procurement (MYP) for 80 additional C-17 aircraft to complete the 120 aircraft program. The proposal was for a seven year MYP with \$300M for Economic Order Quantity requirements. On 1 Feb 96, USD(A&T) approved the Air Force

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

7c. Program Highlights (Cont'd):

proposal to proceed with this MYP program upon enactment of implementing legislation. The C-17 System Program Office is currently negotiating and will be ready to sign the MYP contract upon Congressional approval.

8. Threshold Breaches:

There are no breaches to the Acquisition Program Baseline dated 1 Mar 96, and no Rynn-McCurdy unit cost breaches.

9. Schedule:

a. Milestones --

b. Previous Change Explanations --

First Flight changed from Jun 91 to Sep 91 based on the actual date of T-1 first flight.

IOC changed from Jun 93 to Jan 95 due to a change in IOC definition from P-12 to P-16, delayed delivery schedule, and additional AMC requirements.

DT&E Complete changed from Dec 93 to Nov 94, IOT&E Start changed

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

9b. Schedule (Cont'd):

from May 93 to Sep 94, and IOT&E Complete changed from Nov 93 to Mar 95 due to the following reasons: delayed delivery schedule, change in the interpretation of "DT&E Complete" to include completion of all-weather testing, deferred manufacturing work, immature aircraft systems, less than planned flight test efficiency, flight test rebaselining, and AFOTEC's finalization of criteria for starting IOT&E.

RM&AE changed from Oct 94 to Feb 95 due to the revised contract delivery schedule and the additional AMC requirements. The 30 day link between IOC and RM&AE was removed and RM&AE was rescheduled from Feb 95 to Jul 95.

Milestone IIIB changed from Sep 93 to Nov 95 due to delayed delivery schedule, flight test rebaselining, and AFOTEC's finalization of criteria for starting IOT&E. Nov 95 was designated for the DAB decision to extend the production program beyond the 40 aircraft probationary period.

The Full Rate Production Contract Award and Depot Support Date current estimates were changed to TBD pending the Milestone III decision.

FOC changed from Sep 01 to May 03 because of the delayed delivery schedule. FOC was changed from May 03 to Sep 98 based on delivery of 40 versus 120 aircraft and then to TBD pending the MSIII decision.

c. Current Change Explanations --

(Ch-1) The full rate production contract award change from TBD to Feb 96 to reflect the award of the Lot VIII contract on 23 Feb 96.

(Ch-2) The RM&AE completion date changed from Jul 95 to Aug 95. This change reflects the 5 Aug 95 completion of RM&AE. The date reported in the last SAR reflects the scheduled beginning of the effort.

b. Previous Change Explanations --

Payload weight requirements were changed to show that the payload for the program was decreased to account for government directed changes to the design of the C-17 aircraft. The current estimate for Payload at Range changed from 167,006 lbs to 160,000 lbs, and the current estimate for Range Unfueled changed from 2,372 to 2,400 nautical miles.

The estimate for Landing Field Length was adjusted from 2,541 to 2,740 feet to account for the latest projected operating weight and for higher approach speeds which resulted from a preliminary assessment of high lift aerodynamic testing. The Current Estimate for Takeoff Field Length was adjusted from 7,370 to 7,660 feet to account for an increase in the maximum takeoff gross weight from 580,000 lbs to 585,000 lbs.

Estimates for the Reliability, Maintainability, and Availability parameters were changed to account for the latest analyses and aircraft design. Maintenance Manhour per Flying Hour, MTBML, MTBMC and MTBR changed due to system maturity and RMAA investments. The demonstrated performance for Maximum Payload changed from N/A to 169,000 lbs. This value represents data from the completion of the Static Test.

The Payload at Range (2,400nm) changed from 155,083 lbs to N/A because there was no range payload demonstration at the 2,400 nm parameter. Range unrefueled was not demonstrated at the 2,400 nm parameter; the metric is reported at 3,200 nm.

Landing Field Length reflects changes in the 10 Nov 94 APB. Demonstrated performance was changed from N/A to 2,500 feet. On 18 Nov 94, the C-17 landed with 161,000 pound payload in 2,500 feet. Takeoff Field Length current estimate improved to reflect analysis on the final flight test data.

Demonstrated and current estimate for back-up capability was improved from 2% to 3.8%. Demonstration was completed in actual conditions at McChord AFB WA on 24 May 94.

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

10b. Performance Characteristics (Cont'd):

Turning Capability was added in the Nov 94 APB. An unassisted 180 degree turn on a paved runway 90 feet wide (threshold)/on a USMC expeditionary airfield, aluminum mat, 96 feet wide (objective). The capability to turn 180 degrees unassisted on a 90 feet wide runway was demonstrated during flight test at Edwards AFB CA.

Vehicles/Rolling Stock/Outsize Cargo was added in the Nov 94 APB. The C-17 has demonstrated the capability to carry rolling stock to include outsize cargo.

Airdrop added in the Nov 94 APB. The C-17 has the capability to airdrop 102 paratroopers, 60,000 lbs (single platform) heavy equipment loads (threshold) 110,000 lb objective, and 30 Container Delivery System (CDS) bundles (threshold).

c. Current Change Explanations --

(Ch-1). These performance characteristics were deleted from the APB in Nov 94. Current metrics are not available for these parameters. These items will not be reported in subsequent Selected Acquisition Reports.

(Ch-2). The demonstrated performance value for Mean Time Between Maintenance Corrective, Mean Time Between Removal (MTBR), and Mean Manhours to Repair improved to reflect results of the RM&AE. The current estimate for Mean Manhours to Repair is a projection of the long term mature value.

(Ch-3). The value for demonstrated performance for Payload Range at 3,200nm changed from N/A, reported in the 31 Dec 94 SAR, to 113,000 pounds. In Aug 95, the aircraft carried a 113,000 pound payload on a 3200nm operational test mission to demonstrate the payload range threshold.

The current estimate for Payload Range at 3,200nm increased from 127,000 pounds reported in the last SAR to 131,000 pounds. The estimate is based on an updated computational projection of the capability of P33, which is the baseline performance aircraft.

(Ch-4). The demonstrated performance and current estimate for Turning Capability changed from 90 to 96/80 to reflect the demonstrated 180 degree turns on both a 96 feet wide aluminum mat and an 80 feet wide paved runway. Both were accomplished during flight testing at Edwards AFB CA.

(Ch-5). The demonstrated performance of number of persons airdropped changed from 70 to 102 since the last report. A series of

C-17, December 31, 1995

11a. Total Program Cost and Quantity (Cont'd):

The APB dated 1 Mar 96, reflects the proposed MYP savings.

The program base year changed from BY81 reported in the 31 Dec 94 to BY96 in the current report. The Office of the Secretary of Defense raw inflation rates published in Jan 95 were used to convert the Production Estimate to BY96. The rate for aircraft procurement was 1.868; the rate for both development and construction was 1.721.

The program base year changed from BY81 reported in the Dec 94 SAR to BY96 reported in the current report. Raw inflation rates published in Jan 95 were used to convert the production estimate and previous changes to BY96.

b. Previous Change Explanations --

RD&E

Economic: Revised economic escalation indices.

Engineering: Revised estimate for the development of the Airlift Defensive Systems program.

Estimating: Revised estimates as a result of updated annual estimates, external program decisions, adjustments of current and prior year escalation changes, additional Economic Price Adjustment liability,

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

13b. Cost Variance Analysis (Cont'd):

Congressional funding adjustments, reflection of prior actual costs, and miscellaneous DoD program adjustments. In addition, budget for the 6 Jan 94 settlement for flight test was added.

Other: Additional funding provided through 6 Jan 94 settlement (claims, flight test) between the government and contractor.

Support: Revised estimates as a result of updated annual estimates of contractor and other government costs for training, data, simulator, and peculiar support equipment; current and prior year escalation changes; and current and prior year actuals. Support effort required by the 6 Jan 94 settlement for flight test was added.

Procurement

Economic: Revised economic escalation indices. An economic adjustment was made for the negative program change.

Quantity: Deleted 170 aircraft.

Schedule: Changed schedule applicable to stretch-out of program. Revised procurement quantity for FY92 and FY93 from 6/12 to 4/8. Recategorized variance in the Dec 90 SAR. Allocation to schedule due to quantity decrease in Dec 93 SAR. Revised schedule for FY95-FY96 from buy profile 8-12 to 6-8.

Engineering: Added Defensive Systems (Defensive Avionics capability) to the C-17. Revised estimate for TACAN and Airlift Defensive Systems program. Allocation to engineering due to quantity decrease.

Estimating: Estimating changes as a result of updated annual estimates, external program decisions, including slower build rates, adjustments for current and prior year actuals and escalation changes, additional requirement to fund lots to ceiling, Congressional funding adjustments, miscellaneous DoD program adjustments, and a revised multi-year procurement strategy. Allocation to estimating due to quantity decrease.

Other: Additional funding provided for the 6 Jan 94 settlement enactment. The settlement between the government and the contractor resolved claims and initiated systems improvements to CAD/CAM, Management Information System, and Advanced Quality System.

Support: Estimating changes as a result of the aircraft quantity reduction, updated annual estimates,

13b. Cost Variance Analysis (Cont'd):

external program decisions including slower build up rates, adjustments to current and prior year actuals and escalation changes, revised multi-year procurement strategy, Congressional funding adjustments, incorporation of stock funding for initial spares, addition of Common Support Equipment (CSE) due to Integrated Weapon System Management (IWSM) and Interim Contractor Support (ICS) and changed requirements for support equipment and spares due to changes in quantity.

MILCON

Economic: Revised economic escalation indices.  
Schedule: The schedule change is due to a delay in projects to later years due to program stretch out.  
Estimating: Decreased Military construction projects applicable to the decrease of aircraft. Adjustment for current and prior year escalation changes. The estimate increased due to rephasing the buy and delivery schedule. Funding was realigned to support C-17 program activities.

15. Contract Information (Cont'd):

Explanation of Change:

**COST VARIANCE:** The majority of the positive cost variance through Dec 95 was due to an anomaly which occurred when Congress decided to buy two fewer aircraft than were provided for in the long lead procurement. The costs associated with these two aircraft were being charged to Lots V and VI (overstating these costs) instead of Lot VII (understating costs). A "Ship Roll" journal was made to align parts, standards, and actuals to the appropriate contract. Costs were transferred on the flaps and slats to align fiscal year costs with the build schedule.

**SCHEDULE VARIANCE:** The positive schedule variance for the reporting period was due to the early accomplishment of planned work. Aircraft P-18 through P-20, the last aircraft in Lot V, were delivered early and performance improvement was taken. An improved painting process which reduced painting labor hours was implemented beginning with P-19. In addition, statistical process control analysis indicated 75% of the paint was too thick. MDA worked with the vendor to improve paint quality. This process improvement will reduce paint time on subsequent aircraft.

The Lot V contract is 97% complete as of this reporting. The last aircraft of this lot was delivered Jun 95.

This is the final time this contract will be reported in the SAR.

15. Contract Information (Cont'd):

buy two fewer aircraft than were provided for in the long lead procurement. The costs associated with these two aircraft were being charged to Lots V and VI (overstating these costs) instead of Lot VII (understating costs). A "Ship Roll" journal was made to align parts, standards, and actuals to the Lot VII contract.

The crew door and effort on the enhanced container vertical rails was moved to the Macon GA facility to take advantage of lower labor rates.

**SCHEDULE VARIANCE:** The majority of the improved schedule variance was attributable to the Northrop-Grumman-Vought propulsion subsystem. Northrop-Grumman-Vought implemented a more accurate way of calculating aircraft percent completion. In the old method, performance was taken equally on all parts. The higher priced parts were on time; however, this performance was reduced by the late delivery of lower priced parts. The new system weights performance by dollar value. Another major accomplishment was the delivery of the mission computer/electronic display subsystem. The early delivery of the main landing gear kits also contributed to the improved variance.

The Lot VI contract is 91% complete as of this reporting.

This is the final time this contract will be reported in the SAR.

Explanation of Change:

**COST VARIANCE:** The negative cost variance for Lot VII is due to \$5.7M incorrectly charged to Lot VII for a P-26 Horizontal Stabilizer which belonged in Lot VI. The charge was reversed in Jan 96.

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

15. Contract Information (Cont'd):

**SCHEDULE VARIANCE:** The unfavorable schedule variance is due to a number of engineering design changes, adjustments in tooling, and waivers which were incorporated in the first aircraft of Lot VII. These changes resulted in the workers having to change manufacturing procedures which negatively impacted the learning curve. Schedule improvement is anticipated as the workers gain experience with new production processes. Out-of-position work for the wing spars, panels and wing half join contributed to the variance. Cargo ramp work in St. Louis was late in starting due to parts shortage. MDA has implemented a recovery plan including overtime authorization and staff reassignments to regain the schedule.

This is the first reporting of this contract in the SAR.

Explanation of Change:

**COST VARIANCE:** The cost variance is positive due to performance being taken without the associated actual costs being completely journaled from management risk to the appropriate cost accounts. This problem will be resolved in early 1996 when the journals are completed. Part of the favorable cost variance is attributable to reduced staffing and integrated product team expenditures being below planned amounts. Since much of the work is level of effort, full performance is being taken at these reduced levels.

**SCHEDULE VARIANCE:** The primary reason for the negative schedule variance on this contract is due to the nacelle project underestimating the scope of the engineering effort. This has caused the nacelle manufacturer, Northrop-Grumman-Vought, to fall behind schedule. Action is being taken to acquire more work stations and to increase the number of engineers. If MDA follows these corrective actions, schedule should be recaptured. Another schedule driver was

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

15. Contract Information (Cont'd):

in the fuselage assembly improvement phase III & IV projects. The contractor assumed gaining project approval, starting tool design and fabrication in the same month. When project approval slipped two months, the project phasing required adjustment. Schedule will be replanned starting in April 1996 with no impact to the planned end date.

This is the first reporting of this contract in the SAR.

16. Program Funding Summary (Current Estimate in Millions of Dollars):

a. Program Status --

b. Approved Design-to-Cost Objective -- N/A.

- Design-to-Cost Objective never established.

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

18. Operating and Support Costs:

a. Assumptions and Ground Rules --

The average annual cost per C-17 squadron was derived by dividing the Air Force Service Cost Position for the total O&S cost by the nine operational squadrons and further dividing by the number of years covered by the estimate (36 years, from FY96 through FY31). This estimate was done in FY96 constant dollars.

The O&S costs were based on a total of 120 aircraft, of which 96 were operated under the Active/Associate Reserve concept, 6 under the Air Reserve Component Unit Equipped (ARC UE), 8 training aircraft, and 10 in backup inventory. The estimate included direct and indirect costs, as described below.

(1) Direct costs include: mission personnel, unit-level consumables, depot maintenance, Contractor Logistics Support (CLS) and sustaining support costs. Mission personnel consist of aircrew, base maintenance, wing/squadron overhead, and weapon system security personnel requirements. Unit-level consumables include: fuel, base maintenance supplies, and depot-level reparable. Depot maintenance costs capture: airframe overhaul, repair of ground support equipment, and depot support activity. CLS covers the costs of maintaining the engines. Sustaining support includes: replacement support equipment, sustaining engineering, and sustaining software support.

(2) Indirect costs include: personnel support and installation support activities. Personnel support covers medical personnel and supplies, training (aircrew training system contracted support, maintenance trainer contract support, initial C-17 flying training, and initial specialty training), and permanent change of station costs. Installation support covers base operating and real property maintenance personnel, and miscellaneous operating expenses.

\*\*\* UNCLASSIFIED \*\*\*

C-17, December 31, 1995

18b. Operating and Support Costs (Cont'd):

b. Costs -- (FY 1996 Constant (Base-Year) Dollars in Millions)

| Cost Element           | Avg Annual Cost Per<br>C-17 Squadron | Avg Annual Cost for<br>Antecedent System |
|------------------------|--------------------------------------|--|
| Mission Personnel      | 26.3                                 | N/A                                      |
| Unit-Level Consumables | 47.6                                 | N/A                                      |
| Depot Maintenance      | 2.7                                  | N/A                                      |
| Contract Logistics Spt | 2.6                                  | N/A                                      |
| Sustaining Support     | 2.2                                  | N/A                                      |
| Indirect Support       | 23.5                                 | N/A                                      |
| Total                  | 104.9                                | N/A                                      |

The above costs were derived directly from the FY96 Air Force Service Cost Position, which was based on a 120 aircraft program.

The dollars represent an average O&S cost and do not reflect the way the program would be budgeted. The mission personnel category captures the Active Duty, Associate Reserve and ARC UE mission-related manpower requirements. The required manpower and aircraft operating costs for the eight training aircraft are captured under the indirect support category.

There is no antecedent system for the C-17 program. The C-17 has a much wider range of capabilities than exists in the current airlift aircraft. It can carry outsize cargo similar to the C-5, airdrop similar to the C-141, and operate in small austere environments similar to the C-130.

c. Contractor Support Costs -- None.

The costs associated with the interim contractor support contracts are under the acquisition portion of the estimate. For estimating purposes, the engines were treated as being under a contractor support concept.

4. (U) Program Elements/Procurement Line Items (Cont'd):

MILCON:

FE 0305160F

5. (U) Related Programs:

National Polar Orbiting Operational Environmental Satellite (NPOESS)

6. (U) Mission and Description:

The mission of the Defense Meteorological Satellite Program (DMSP) is to provide an enduring and survivable capability, through all levels of conflict consistent with the survivability of the supported forces, to collect and disseminate global visible and infrared cloud data and other specialized meteorological, oceanographic, and solar-geophysical data required to support worldwide DoD operations and high-priority programs. Timely data are supplied to Air Force Global Weather Central, the Navy Fleet Numerical Oceanography Center, the Air Force Space Forecast Center, and to deployed tactical terminals worldwide. The DMSP system is the only DoD meteorological satellite system. It consists of two three-axis stabilized satellites in 450 nautical mile sun-synchronous polar orbits (98.7 degrees inclination), command readout stations, command and control facilities, strategic data processing facilities, worldwide fixed and mobile tactical terminals, and communication satellite links. The DMSP Block 5D-2 Improved (S11-14)/5D-3 (S15-20) systems replace the Block 5D-2 system. Three Block 5D-2 Improved satellites are operational.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

The Defense Meteorological Satellite Program is a Joint-Service program in accordance with the Memorandum of Agreement on Joint Service Management and Operations, dated 15 Dec 76. The program is a continuing program to support requirements of the special strategic missions, the Joint-Service mission, and the Joint Chiefs of Staff. In Sep 83, DMSP awarded a multiyear procurement contract for 5D-2 Improved spacecraft S11-S14; delivery of the satellites was completed in Nov 90. In Nov 91, satellite F-11 (S-12) was launched from Vandenberg AFB; satellite F-12 (S-11) was launched in Aug 94 and satellite F-13 (S-13) in Mar 95. In FY85 Headquarters Air Force directed the procurement of S-15. A contract for 5D-3 development spacecraft (S-15) was awarded in Jul 86; S-15 was delivered in Dec 91. Congress approved the multiyear procurement of five 5D-3 spacecraft in Sep 88; the contract was awarded in Jun 89. A multiyear procurement contract for four Operational Linescan Systems (OLS) was awarded in Jan 84; delivery of the sensors was completed in May 89. In Sep 88, a contract for five 5D-3 OLSs was awarded; delivery of the sensors was completed in Apr 95. Congress approved transition from Atlas to Titan II with Titan II initial launch capability in Oct 90.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

DMSP, December 31, 1995

7a. (U) Program Highlights (Cont'd):

Four Special Sensor Microwave Imager (SSM/I) and one Special Sensor Magnetometer (SSM) were delivered in CY89. In Mar 89, a contract for the Special Sensor Microwave/Imager Sounder (SSMIS) was awarded; Critical Design Review (CDR) was completed in Sep 91. In Aug 94, a Request for Equitable Adjustment (REA) from Aerojet was received. A Special Sensor Ultraviolet Spectrographic Imager (SSUSI) was delivered in Mar 94 for S-16, and a Special Sensor Ultraviolet Limb Imager (SSULI) was delivered in Oct 94. Precipitating Particle Spectrometers (SSJ4/5) were delivered in Oct 93 and Jan 95 and a Plasma Monitoring System (SSIES-3) was delivered in Dec 93. In Mar 94, the Special Sensor Magnetometer #2 & #3 were delivered for integration onto satellites S-17 and S-18 and the Special Sensor Laser Threat Detector (SSP) was delivered; S-11/F-12 was launched from Vandenberg AFB in Aug 94. Block 5D-3 Laser Threat Detection Sensors (SSP) were delivered in Dec 93 and May 94.

In Jan 86, the Fairchild Satellite Operations Center (FSOC) contract was awarded. The Satellite Data Handling System (SDHS) was turned over to Air Force Global Weather Central (AFGWC) in FY86; a contract for SDHS shared processing was awarded in Sep 88. The DMSP Integrated Weapon System Management (IWSM), Single Manager, Concept of Operations (CONOP) was signed in Jun 93. The DMSP IWSM Implementation Plan was approved on 22 Dec 93.

The contract for Mark IVB Tactical Terminals was awarded in Oct 88; IOT&E was completed in May 92. The production option for six fixed Mark IVB systems was exercised on 19 Jun 92. Three Mark IVBs were turnover to the sites in FY94; the Guam Mark IVB, the Kadena AFB Mark IVB and Elmendorf AFB Mark IVB. Delivery of all terminals was completed in Apr 95. In Nov 90, two contracts for the procurement of Rapid Deployment Imagery Terminals (RDIT) were awarded; deliveries were completed in Jun 91. Two contracts for the development of a Small Tactical Terminal were awarded in Dec 92; a low rate production contract was issued in Jun 94 with first delivery in Jan 95.

b. (U) Significant Developments Since Last Report --

On 6 Jan 95, the Operational Linescan System (OLS) Follow-on Support and Service RFP was released; contract awarded to Westinghouse Electric Corporation in May 95. On 13 Jan 95; the Special Sensor Precipitating Electron Spectrometer (SSJ4) for S-13 was delivered; the Special Sensor Ion Electron spectrometer (SSIES)3 was delivered for S-16 on 15 Feb 95. On 9 Jun 95, IOT&E was completed for the Small Tactical Terminal (STT). The contract option for full rate production was exercised in Sep 95. On 24 Mar 95, the F-13 Spacecraft was successfully launched from Vandenberg AFB on the last Atlas E booster in the Air Force inventory. On 5 Apr 95, the Lajes Field Mark IVB was

7b. (U) Program Highlights (Cont'd):

delivered. The last of five OLS production units was delivered in Apr 95. In Jul 95, the SSMIS Independent Review Team (IRT) briefed its findings to SAF/AQ. The Special Sensor Ultraviolet Spectrographic Imager (SSUSI) was delivered on 13 Sep 95 for S-17 spacecraft. The Special Sensor Ultraviolet Limb Imager (SSULI) was delivered on 14 Sep 95. On 19 Oct 95, Version 6 software Formal Checkout Qualification Testing was completed. The revised spacecraft delivery schedule was successfully negotiated on 19 Dec 95. On 21 Dec 95, Aerojet, the SSMIS contractor, submitted an updated claim for \$94M (compared to \$40+M in Aug 94).

The DMSP is expected to satisfy all mission requirements.

c. (U) Changes Since As Of Date --

The Special Sensor Ultraviolet Limb Imager (SSULI) was delivered on 7 Feb 96 for the S-17 spacecraft. A Small Tactical Terminal (STT) unit was delivered to Bosnia to aid the troops in their peace-keeping mission.

8. (U) Threshold Breaches:

There is a cost breach against the AFAS Acquisition Program Baseline (APB) dated 5 January 1993. The breach is due to the addition of four years of program support. A program deviation report and baseline change request has been submitted. There are no Huns-McCurdy unit cost breaches.

9. (U) Schedule:

a. (U) Milestones --

Note: Block 5D-2 Improved/Block 5D-3 IOC will occur 30 days after launch (completion of on-orbit checkout). As DMSF launches on demand, no firm estimate is currently available.

b. (U) Previous Change Explanations --

Fairchild Satellite Operations Center IOC slipped from Sep 88 to May 89 due to delay in contract award. Spacecraft S-15 design contract award slipped from May 86 to Jul 86 when additional technical evaluation of the proposal was required. S-11 delivery slipped from Jul 87 to Dec 88 due to materials problems, late delivery of piece-parts, diversion of manpower to support two launches, and late delivery of Government Furnished Equipment (GFE). Thule Command Readout Station (CRS) slipped from Sep 87 to Feb 88 due to S-Band downlink capability modification. Deactivation of Loring CRS slipped from Sep 88 to Apr 90 by determination of AFSPACECOM. Delivery dates

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

DMSP, December 31, 1995

9b. (U) Schedule (Cont'd):

for Spacecraft S12-15 were adjusted due to increased satellite on-orbit lifetime. PSOC Operational slipped from May 89 to Aug 89 due to the non-availability of critical spares. Award of the 5D-3 multiyear contract slipped from Mar 89 to Jun 89 due to protracted negotiations. Satellite Required Availability dates were changed from TBD to the delivery date for each spacecraft since these spacecraft have all been delivered and are available for launch. Satellite S-12 delivered a month ahead of estimate due to efficient test cycle. Delivery of satellite S-15 slipped from Sep 91 to Dec 91 due to manufacturing and test problems. IOC for Block 5D-2 Improved was changed from TBD to Dec 91 when the first satellite in the block became operational. S-16 Primary Sensor delivery slipped from Sep 92 to Nov 92 due to late subcontractor piece parts deliveries; an additional slip to Feb 93 resulted from problems encountered during thermal vacuum test. Begin Mark IVB IOT&E slipped from Sep 90 to Oct 91 due to PMD amendment adding Mission 22 and development problems; a further slip to Mar 92 was due to software integration problems impacting system stability; this delay caused Mark IVB Production Start to slip from Feb 91 to Jun 92 and Final Delivery to slip from Sep 95 to Sep 97. Milestone IV slipped from Sep 93 to Sep 97 due to delay of program. Milestone IV was then accelerated from Sep 97 to Jun 93 due to an Air Force determination that Milestone IV was more appropriately held prior to significant risk reduction activity (FY93) versus prior to Engineering Development (FY97); a further slip from Jun 93 to Jul 95 resulted from the rescheduling of the Air Force Requirements Summit.

c. (U) Current Change Explanations --

(Ch-1) Final Mark IVB delivery changed from Sep 97 to Apr 95 with delivery of the 7th and last Mark IVB tactical terminal.

(Ch-2) The presidentially directed convergence of the existing national environmental weather satellite system into a Department of Commerce and Department of Defense combined satellite system has eliminated the DMSP requirement for a Milestone IV decision for a DMSP Block 6. A deviation report for the removal of Milestone IV has been submitted.

DMSP, December 31, 1995

10a. (U) Performance Characteristics (Cont'd):

|                                | PdE | Approved<br>Program<br>Objective/Threshold | Demon-<br>strated<br>Perf | Current<br>Estimate |
|--------------------------------|-----|--|---------------------------|---------------------|
| (b)(1)                         |     |  |                           |                     |
| Autonomous<br>Operation (days) | N/A | 60 / 7                                     | N/A                       | 7                   |

The Altitude parameter is 450 nautical miles with a difference between apogee and perigee of no more than 30 nautical miles.

The current estimate for the technical parameters represents anticipated values based on current on-orbit satellite performance. Mean mission duration for both the 5D-2 Improved and 5D-3 spacecraft represent anticipated values and are based on current on-orbit performance of similar satellites.

b. (U) Previous Change Explanations --

Previous entry for Early Orbit Checkout allowed up to 90 days in a transfer orbit for Space Shuttle launch; program has transitioned to an ELV. Survivability parameters are included to reflect the Acquisition Program Baseline. Mark IVB data replaced Mark IV data in the 30 Jun 89 SAR. Mean Time Between Corrective Maintenance Actions and Mean Time Between Critical Failures for the Mark IVB system decreased from 720 to 705 hours and 2000 to 1945 hours, respectively, due to the addition of Mission 22. The Block 5D-2 Improved Mean Mission Duration estimate increased from 33 to 39 months based on historical experience with similar satellites.

c. (U) Current Change Explanations --

Due to on-orbit performance data from satellite S-11, the demonstrated performance for Satellite Altitude (nautical miles), Inclination (degrees), and Mean Mission Duration (months) for 5D-2 Improved changed from N/A to 450, 98.7 degrees, and 48 months respectively.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised escalation indices.

Engineering: Developed satellite autonomy capability; added new wind sensor technology effort but requirement later withdrawn; de-scoped survivability of 5D-3 spacecraft (S-15); increased vacuum ultraviolet (SSUV) sensor development authorized, but authority later withdrawn.

Estimating: Adjustments to correct current & prior year escalation; adjustments to current & prior years to reflect actuals; definitized Titan II ELV contract as 5D-3 booster; definitized 5D-3 development spacecraft (S-15) contract; re-estimate of 5D-3

\*\*\* UNCLASSIFIED \*\*\*

DMSP, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

development effort and performance incentives; adjustment of on-orbit performance incentives for projected launch date; additional development for wind measuring sensor; reduction resulting in delay of spacecraft (S-15) and primary and missions sensors and decrease in technical support; added funding for Titan II launch vehicle integration; revised estimate for spacecraft and sensor support and service effort; revised estimate of sensor calibration/validation costs; decreased estimate of program management and technical support; increase for system engineering; decrease in spacecraft and sensor studies; revised estimate for microwave imager/scanner development; extension of support and service activities for two years due to delay of follow-on program.

Support: Increase in Automated Weather Product Driver System application; deleted Shuttle-Launch Base requirement; upgrade of deployed DMSP tactical terminals and development of a new combat tactical terminal added; increase to C3 and DMSP tactical terminal upgrade requirements; revised estimate for development of new combat tactical terminal; increased cost for launch and on-orbit checkout for spacecraft S-15 and related launch and on-orbit costs; adjustment to Mark IVB development effort; adjustment to tactical terminal development estimate due to design problems; launch facility improvements due to space policy security requirements; revised estimate of launch facility improvement costs; revision to system engineering support for ground systems; revised estimate of ground system engineering studies; reprioritization of Tactical Data Processing requirements by user; re-estimate of small tactical terminal development.

Procurement

Economic: Revised escalation indices.

Quantity: Add one 5D-3 satellite (S-20) due to extension of Block 5D-3 program.

Schedule: Restructure of multiyear procurement of Block 5D-3 spacecraft S16-20.

Engineering: Descoped survivability and added classified sensor to S16-20 spacecraft; added requirement for solar x-ray imager sensor (SXI); funding for SXI withdrawn.

Estimating: Adjustments to correct current and prior year escalation; adjustments to current & prior years to

DMSP, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

reflect actuals; funding reallocated to complete spacecraft S8-10 which are not included in SAR; extension of 5D-3 program; transition to Titan II ELV as 5D-3 booster; funding for Titan II launch vehicle refurbishment for DMSP S16-20 transferred to Space Boosters Program (PE 35119F); fully funded buy of S16-20 and associated primary sensors restructured as a multiyear procurement; revised estimate of OLS and spacecraft (for S16-20) using Jun 85 cost data; upgraded production/test equipment model for primary sensor (OLS 13-21); integration funding for this added in FY 87; descope merger of two mission sensors and re-estimated mission sensor mix in Jun 85 for S16-20; acceleration of water vapor profiling capability; loss of advance material buy funding for primary sensor; restructure of primary sensor buy from multiyear procurement to fully funded annual buy; revised estimate for technical support and mission sensor contingency; refinement of estimate for restructuring multiyear procurement of Block 5D-3 spacecraft S16-20; definitization of procurement of primary sensor OLS 17-21; re-estimate of special sensor buy as a competitive procurement; refinement of estimate for procurement of space and environmental sensors; definitization of multiyear procurement of spacecraft S16-20; adjustment of spacecraft and primary sensor incentives to projected year of payment; extension of Block 5D program due to follow-on delay; directed transfer of support and launch effort funding from operations and maintenance to missile procurement.

Support:

Adjustments to correct current and prior year escalation; adjustments to current and prior years to reflect actuals; refinement of Multi-Purpose Satellite Operations Center (MPSOC) upgrade requirement; revised estimate of initial spares requirement; increased cost for replacement of out-dated site equipment; definitization of DMSP tactical terminal upgrade requirements; tactical terminal cost growth; re-estimate for DMSP connectivity to New Hampshire tracking station; reprogramming of spares funding; refined estimate for Mark IVB site prep/shelter procurement; revised estimate for replacement of site equipment using off-the-shelf equipment; revised estimate of Small Tactical Terminal procurement including revised

DMSP, December 31, 1995

19b. (U) Cost Variance Analysis (Cont'd):

user requirements; adjustment to FFRDC funding;  
directed transfer of ground system support efforts  
from operations and maintenance to missile  
procurement.

MILCON

Economic: Revised escalation indices.

Support: Adjustments to correct current and prior year  
escalation; adjustments to prior year to reflect  
actuals.

15. (U) Contract Information (Cont'd):

| Current Contract Price |                |            | Estimated Price At Completion |                        |
|------------------------|----------------|------------|-------------------------------|------------------------|
| <u>Target</u>          | <u>Ceiling</u> | <u>Qty</u> | <u>Contractor</u>             | <u>Program Manager</u> |
| \$104.2                | \$115.2        | 5          | \$115.2                       | \$115.2                |

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$-40.8              | \$-4.1                   |
| Cumulative Variances To Date (12/31/95) | \$-53.4              | \$-2.8                   |
| Net Change                              | \$-12.6              | \$1.3                    |

Explanation of Change:

Program Manager estimated price at completion decreased due to the contractor's failure to earn the award fee available during this period. The estimated price at completion includes both the fixed price production effort and the cost plus development effort on the contract. The estimated price for the fixed price portion is constrained by the ceiling of \$72.6M which is the limit of the government's liability on the production effort. Also included in the estimated price at completion is \$0.6M in award fees earned, \$2.0M in potential award fees, and \$4.3M in potential on-orbit performance incentives. Neither award fees nor incentives are included in the current contract price data.

Increase in cost variance is due to costs associated with the schedule extension for flight unit deliveries. Additional contributors are: extensive anomaly resolutions due to failures uncovered during EMI/EMC, rework costs associated with calibration, mixer failures and problem resolution and implementation.

The contract is currently funded to ceiling price. The contractor has encountered numerous test failures during integration. The program office is continually working with the program integrator to reduce the impact of late sensor delivery to satellite integration. The contractor has submitted an updated certified Request for Equitable Adjustment (REA) to the government for over \$94.0M dollars. The government is currently evaluating the claim. Schedule variance improved due to incorporation of new delivery date and replan of associated efforts.

There is minimum impact to the program at this time.

| Cumulative Variances To Date (05/28/95) | <u>\$-0.3</u>        | <u>\$0.0</u>             |
| Net Change                              | \$4.7                | \$1.5                    |

Explanation of Change:

The change to the current contract target price and ceiling price is due early delivery of the last OLS unit.

Program Manager estimate decreased to reflect last unit delivery.

Included in the estimate price at completion is \$4.4M award fees earned, \$0.9M in potential award fees, and \$7.3M in potential on-orbit performance incentives.

The cost and schedule variance improved due to resolution of test problems with OLS 20.

There is no impact to the program.

THIS CONTRACT WILL NO LONGER BE REPORTED IN THE SAR. ALL SENSOR UNITS HAVE BEEN DELIVERED.

| Net Change                              | \$-13.3              | \$8.5                    |

Explanation of Change:

The increase to the current contract target and ceiling prices over the original values is due to contract modifications for mission sensor integration, the advanced flight vehicle simulation facility, real-time data smooth transmitters and award fee/orbital incentives.

The Program Manager's estimate at completion exceeds target price based upon Cost Performance Report (CPR) indicators, and chronic problems associated with solar arrays, power supply electronics (PSE), and batteries. Problems with power supply electronics, which previously caused the majority of schedule delays (including the need to replan the schedule), have been solved. Lingered solar array qualification problems, however, have yet to be completely overcome and threaten to further delay spacecraft integration and test schedules. Acknowledging the significant amount of time these spacecraft are expected to remain in storage before launch, the SPO has developed a well thought out limited shelf life strategy. Extended procurement and delivery dates for Pyrotechnic devices, Apogee Kick Motors (AKMs) and batteries have all been carefully planned to minimize "aging out". The estimated price at completion includes \$3.7M in award fees earned, \$7.5M in potential future awards, and \$16.9M in potential on-orbit performance incentives.

The decrease in cost variance has two primary causes. The first involves the expensive repair and rework of sub-system components such as Reaction Wheel Assemblies (RWA), transmitters, solar arrays, batteries and S16 PSE. The second, however, involves a granularity problem between point of receipt of material goods and their point of issue to the manufacturing floor. Most of this problem has been addressed as part of the schedule replan concluded on 19 Dec 95.

The negative schedule variance improved significantly due to the large number of materials released to the manufacturing floor. Subsystem manufacturing has also been intentionally accelerated in order to take full advantage of future manpower savings coincident with plant closure.

There is minimum impact to the program at this time.

a. (U) Deliveries to Date --

|             | <u>Plan/Actual</u> |
|-------------|--------------------|
| EDT&E       | 1/1                |
| Procurement | 4/4                |

b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

Operations and support costs include all costs of operating, maintaining, and supporting the DMSF spacecraft from dedicated ground control centers at Fairchild AFB WA (Fairchild Satellite Operations Center) and Offutt AFB NE (Multi-Purpose Operations Center). Costs also include the costs for contractor support for sustaining engineering and the operations personnel at each of the operations centers. These costs do not include the unallocated costs associated with the shared use of remote tracking stations which are programmed and borne by the Air Force Satellite Control Network and the Consolidated Space Operations Center program elements.

b. (U) Costs -- (FY 1991 Constant (Base-Year) Dollars in Millions)

| Cost Element             | Avg Annual Cost Per<br>5D-2 Constellation | Avg Annual Cost Per<br>(Antecedent) |
|--------------------------|---|-------------------------------------|
| Operations & Maintenance | 11.2                                      | N/A                                 |
| Military Personnel       | 13.1                                      | N/A                                 |
| Other Procurement        | 2.4                                       | N/A                                 |
| Total                    | 26.7                                      | N/A                                 |

No antecedent system for the Block 5D-2 Improved/5D-3 meteorological satellite exist.

18c. (U) Operating and Support Costs (Cont'd):

c. (U) Contractor Support Costs -- (Current (Then-Year) Dollars  
in Millions)

| Funding | FY1995<br>& Prior | FY1996 | FY1997 | Balance<br>To<br>Complete | Total |
|---------|-------------------|--------|--------|---------------------------|-------|
| O&M     | 124.4             | ---    | ---    | ---                       | 124.4 |
| Total   | 124.4             | ---    | ---    | ---                       | 124.4 |

The O&M Support Costs include funding for sustaining engineering and launch for satellites S-11 through S-20 beginning with the delivery of S-11 in FY 1989 and estimated through FY 2000. Beginning in FY 1993, higher headquarters approved the transfer of funding for sustaining engineering and launch to the Missile Procurement appropriation.

(b)(1)

\*\*\*~~CONFIDENTIAL~~\*\*\*

\*\*\* UNCLASSIFIED \*\*\*

DSP, December 31, 1995

7a. (U) Program Highlights (Cont'd):

worldwide.

(U) In 1986, Flight 13 was demated from the Titan 34D booster due to the booster investigations caused by the previous booster disasters, the first time any satellite had been demated from its booster.

(U) The fixed ground stations have been modified with the Large Processing Stations Upgrade (LPSU) main computer replacement and the Peripheral Upgrade Program (PUP). The CGS accepted the PUP equipment in Apr 87 and the OGS in Sep 87.

(b)(1)

(U) Starting with Flight 12 in December 1984, all sensors have undergone Sensor Evolutionary Development (SED) improvements intended to prolong useful life, increase survivability, increase the viewing area, and increase the accuracy of each Satellite.

(U) The SPO has turned over to Air Force Space Command (AFSPC) all Mobile Ground Systems (MGS).

(U) The Central Tactical Processing Program (CTPP) was formed to support the Talon Shield Program and exploit tactical performance capabilities. The Data Control Subsystem (DCS) for Satellite 16 began working operationally in Feb 92. The Upgraded Mobile Ground Terminals 3 and 4 were delivered in Aug 1992.

(U) The System 1 Research, Development, Test & Evaluation (RDT&E) and the System 1 Delivery to CGS (Shelter Installation) contract was terminated for convenience by the government on 15 Dec 92.

(U) The DSP Program Office consolidated with the Follow on Early Warning System (FEWS) Program Office to form the new Space Based Early Warning System Program Office in Apr 93.

(U) DSP awarded a contract for a multi-year procurement of Satellites 23-25 in FY93.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

DSP, December 31, 1995

7a. (U) Program Highlights (Cont'd):

(U) The Satellite Readout Station Upgrade (SRSU) contract has been restructured to accommodate additional Government test and acceptance activities. Testing was stopped 26 Jun 93 due to several deficiencies.

(U) The Laser Crosslink System was terminated due to the change of requirements by the user, Air Force Space Command (AFSPC).

(U) The Mobile Ground Systems delivered Mobile Ground Terminal's 5 and 6 to the site on 8 Sep 93.

(U) The build version of 9.0 software for the Talon Shield Central Tactical Processing Element has been completed and was installed at the National Test Facility (NTF). Full system testing was completed on 27 Jan 94.

(U) Based on AFSPC direction, in the spring of 1991 launch dates were extended from 6 month to 12 month centers, which necessitated the Block 18 restructure. The original Multi-year procurement contract was for six month launch centers.

(U) The changes to the Acquisition Program Baseline (APB) were approved and signed 30 Mar 94 by the Service Acquisition Executive (SAE). The changes made were the termination of the Laser Crosslink and the Satellite Readout Station Upgrade (SRSU) Installation and Checkout (I&C) schedule milestones.

(U) Due to budget reduction and program requirement changes, Satellites 24 and 25 were cancelled on 11 Mar 94 and 30 Jun 94 respectively. As a result of the cancellation, Aerojet delivered a Request for Equitable Adjustment (REA) Proposal for Sensor 23 on 22 Dec 94. Aerojet claimed that with the cancellation of Sensor 24 and 25, they were unable to complete Sensor 23 with the funds remaining on contract. Aerojet submitted an additional proposal on 5 Jan 95. This proposal was a complete bottoms up proposal for production of Sensor 23.

(U) AFSPC declared the SRSU Continental United States (CONUS) Ground Stations's antenna #2 operational on 22 June 1994.

(U) On 22 Dec 94, DSP Flight 17 was launched by the 45 Space Wing from Cape Canaveral AFS, FL.

(U) Attack and Launch Early Report to Theater (ALERT) Initial Operating Capability (IOC) slipped to late February 95 due to problems with the software operating system and the fiber optic Local

DSP, December 31, 1995

7a. (U) Program Highlights (Cont'd):

Area Network (LAN). This problem has since been rectified.

b. (U) Significant Developments Since Last Report --  
Flight 17 Early On-Orbit Testing was successfully completed on 15 Jan 95 and was moved to its operational location.

The Satellite Readout Station Upgrade (SRSU) program achieved a major milestone with the completion of Operational Test and Evaluation (OT&E). The program then declared Initial Operational Capability at the COMUS Ground Station (CGS) in May 95 and CGS System turnover in Jun 95.

The Advanced Radac Data Unit (ARDU) entered a trial period at CGS on 27 Jun 95 and completed the trial period on 18 Jul 95. An operational board was held on 18 Jul 95 and the board approved the system for operational use at CGS. The Overseas Ground Station (OGS) ARDU installation was completed in April 95, and OGS Development Test and Engineering (DT&E) started in late Aug 95.

On 19 Aug 94, SAV/FMBI, through OSD Comptroller direction, rescinded the OSD policy of Jul 92 allowing funding of on-orbit incentive fees for Satellites 18-22 in the year which they were earned. The Block 18 contract restructure was planned using the former DoD policy. As a result, the System Program Office (SPO) requested and obtained additional obligation authority for the incentives in the original year of funding. These funds will cancel prior to being earned by the contractors and will have to be budgeted for again in the year of need.

The Talon Shield/Attack and Launch Early Warning to Theater (ALEXT) program awarded the follow-on contract for Operations and Maintenance (O&M) and development, 28 Sep 95. Using a streamlined solicitation process, the team released Requests for Proposals (RFPs) to industry and awarded the contract almost 3 months faster than the traditional approach. Between Nov - Dec 95 we conducted 3 post-award conferences in which we included our customers and detailed the Integrated Master Plan and Schedule during the same period. The result has been a greater cooperative environment between the SPO, contractor, and customer.

The DSP system is expected to satisfy all mission requirements.

c. (U) Changes Since As Of Date --  
An \$11.5M contract modification for 4 Satellite Readout Station Upgrade (SRSU) Requests for Equitable Adjustment (REAs) were issued on 8 Feb 96. This completes a two year effort to restructure the SRSU contract. A modification for the Block 23 Sensor REA was issued on 20

\*\*\* UNCLASSIFIED \*\*\*

DSP, December 31, 1995

7c. (U) Program Highlights (Cont'd):

Feb 96 to reconcile the effect of canceling Satellites 24 and 25. In the process, \$53M was reprogrammed to this effort, while \$20M was saved during negotiations.

8. (U) Threshold Breaches:

There are no cost or schedule breaches to the AFAE Acquisition Program Baseline (APB) and no Munn-McCurdy unit cost breaches.

b. (U) Previous Change Explanations --

RDTE

Economic: Revised economic escalation indices.

Schedule: Delay in integration effort due to launch standdown.

Estimating: Adjustment for current and prior inflation. Changes associated with software upgrades to support Satellites 14-17. Acquisition strategy change for Laser Crosslink Subsystem (LCS). Cost changes associated with Satellite Readout Station Upgrade (SRSU), development delays in Mobile Ground Terminal (MGT). Reprogramming of FY90-92 funds due to delay of System 1. Revised estimate due to cancellation of DSP-2 upgrade. Restoration of

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

DSP, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

fixed and mobile ground efforts. Transfer of funding from DSP to FEWS program. Additional funding for continued ground system research and development program. Reduced ground software development. Additional requirement for consolidation of ground stations. Additional funding for Talon Shield upgrades. Reduction of FFRDC and non-FFRDC contractor support. Refinement of program estimate.

Transfer of spares to operational command. Consolidated ground requirement realignment to new SBIR program. Increase for ALERT Interim Contractor Support (ICS). Reduction of ECO risk. Additional funding for continued on-orbit support funding.

**Support:** Integration and other program level efforts to support the acquisition of an added satellite. Hardware and software upgrades for ground stations. Increased cost GSU.

Procurement

**Economic:** Revised economic escalation indices. Adjustment for program change related escalation. Economic adjustment for negative program change.

**Quantity:** Acquisition of additional satellites in FY89-93. Decrease of one satellite from 26 to 25. Decrease of an additional 2 Satellites from 25 to 23.

**Schedule:** One year delay in procurement of Satellite 18. Two year delay for Satellite 19. Production delay for Satellites 23-26. Slip buy of Satellites 23-25 from FY91 to FY92.

**Estimating:** Adjustment for current and prior inflation. Revised procurement strategy (two in FY88 versus one each in years FY87-88). Allocation of cost change since the baseline. Change in acquisition strategy associated with MYP vice annual long-lead funding. Refinement of program estimate to reflect change from DSP-2 to DSP-1 satellites and new spacecraft. Adjustment of FY87 funds to reflect actual costs. Refinement of program estimate. Reduction of sensor engineering services and orbital support services. Additional requirement for continued on-orbit support funding. Decreased funding to support FEWS program. Additional requirement for software changes. Refinement of program estimate to reflect change of Block 23 Satellites. Adjustment of FY93 funds to reflect actual costs. Refinement of program

\*\*\* UNCLASSIFIED \*\*\*

DSP, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

estimate to reflect actual Satellite 23 buy. Reduction of sensor engineering services and orbital support services. Correction of a previous variance categorization. Funds realignment for changing program to 12 month launch centers.

Support: Inclusion of previously deleted logistics items to support ground systems, support of additional satellite in FY90-93. Ground Station hardware, acquisition. Addition of Satellite Readout Station Upgrade (SRSU) project, Gramm-Rudman-Hollings and Congressional reductions. Revised prior year actual costs. Decrease to reflect FB funding, Zero Baseline Transfer FY90 funds for GSU, reestimate of initial spares costs, contingent liabilities in FY85, reduction of FY86 funds for logistic support for GSU, additional ground support in FY94. Negotiated value of Satellite Readout Station Upgrade (SRSU) lower than anticipated, FY93-94 delay of logistic support for SRSU, decreased technical support for ground systems, increase in FY85-86 funds for MTF-14 and Link 1/2 efforts. Adjustment for current year and prior year inflation offset. Increase in initial spares requirement. Logistic modifications to existing ground stations. Reduced Aerospace MTS support. Refinement of Peculiar Support Equipment estimate. Additional requirement for initial spares, peculiar support equipment, and other weapon systems support items. Adjustment of FY93 funds to reflect actual costs. Increase for requirement of consolidated ground stations. Correction of a previous variance categorization. Additional funding for continued on-orbit support funding.

MILCON

Economic: Revised economic escalation indices.

Estimating: Adjustment for current and prior inflation.

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$-33.4              | \$0.1                    |
| Cumulative Variances To Date (12/22/95) | <u>\$-33.2</u>       | <u>\$0.3</u>             |
| Net Change                              | \$0.2                | \$0.2                    |

Explanation of Change:

Significant changes are due to undefinitized work on the contract being priced out resulting in an increased negotiated cost and price.

Quantity change cannot be measured in dollars due to a major upgrade of four antennas and two large processing stations and equipment sets installed at several world wide locations.

DSP, December 31, 1995

15. (U) Contract Information (Cont'd):

The Contractor and the Program Manager are in agreement with the Estimated Price at Completion (EPC); the increase is due to data rights and depot hardware purchases (\$12.3). Also, several REAs have been settled (\$11.6).

Additional Interim Contractor Support (ICS) has been procured along with test stations for the government owned depot.

There is no impact to the contract or program.

The SRSU contract is 95% completed and therefore will no longer be reported.

b. (U) Procurement --

(U) Satellites 18-22:  
TRW Space & Defense, Redondo Beach, CA  
P04701-86-C-0022, FPI  
Award: July 30, 1987  
Definitized: July 30, 1987

| Target  | Initial Contract Price |     |
|---------|------------------------|-----|
|         | Ceiling                | Qty |
| \$743.5 | \$782.5                | 5   |

| Current Contract Price |         |     |

|-------------------------------|-----------------|
| Contractor                    | Program Manager |
| \$746.4                       | \$746.4         |

|   | Cost Variance | Schedule Variance |
|---|---------------|-------------------|
| Previous Cumulative Variances           | \$-50.9       | \$-0.1            |
| Cumulative Variances To Date (12/29/95) | \$-51.7       | \$-0.4            |
| Net Change                              | \$-0.8        | \$-0.3            |

Explanation of Change:

Increase in negotiated cost and target price is due to recognizing, reconciling, realigning, and adding funding in conjunction with the billing price adjustment (correction of previous modification).

The contractor's estimated price at completion (EPC) changed due to negotiated cost and target price change.

There is no impact to the contract or program.

The Satellites 18-22 are more than 90% completed and therefore will no longer be reported.

Explanation of Change:

The current contract price change is due to definitization of the Laser Crosslink System (LCS) partial termination and Vibration Isolation Assembly (VIA) effort for Satellite 23 only.

The Contractor's estimated price at completion decreased due to change in negotiated cost.

The government EAC represents the projected EAC when the funds for the LCS termination and the cancellations of Satellites 24 and 25 are taken off the contract. This provides the government with a proactive forecast, more accurately representing the government future commitment. These figures are pending negotiations and could change significantly.

There is no impact to the contract or the program.

15. (U) Contract Information (Cont'd):

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$0.4                | \$1.5                    |
| Cumulative Variances To Date (12/22/95) | \$1.2                | \$-1.0                   |
| Net Change                              | \$0.8                | \$-2.5                   |

Explanation of Change:

The net cost changes resulted from the quantity which was reduced from three to one. The Program Manager's Estimated Price at Completion (EPC) does not reflect these changes pending the negotiations on cancellation of sensors 24 and 25.

The cost variances are insignificant. There is no impact to the contract or program.

16. (U) Program Funding Summary (Current Estimate in Millions of Dollars):

a. (U) Deliveries to Date --

EDT&E  
Procurement

Plan/Actual  
4/4  
19/19

b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

These Operations and Maintenance (O&M) funds implement PMD direction to support system sustaining engineering (orbital satellites, ground data systems, and operational system users), and to continue support of Ground Data Systems (GDS) sensors and survivability-enhanced Satellites 14-23. Support of operational orbital satellites includes anomaly detection and correction, analysis of on-orbit sensor performance, data compilation and analysis, analysis of special-interest, computer support functions, and launch support. These sustaining efforts reflect a relatively stable level-of-effort requirement through the Financial Plan years to support both advanced configuration of new operational satellites, and an aging orbital satellite configuration with increased anomaly resolution requirements. O&S data is of 29 Feb 96.

DIRECTORATE FOR FREEDOM OF INFORMATION  
AND SECURITY REVIEW (OASD-PA)  
DEPARTMENT OF DEFENSE

SBIRS, December 31, 1995

5. (U) Related Programs (Cont'd):

Eyes (BE)), Titan IV, Attack and Launch Early Report to Theater (ALERT)/Talon Shield.

6. (U) Mission and Description:

The Space Based Infrared System (SBIRS) program is a new effort to satisfy key requirements delineated in the SBIRS Capstone Requirements Document (CRD), within the available budget and schedule. SBIRS is an integrated "system of systems", consisting of multiple space and ground elements, with deployment phasing "High now, Low later", simultaneously satisfying requirements in the following mission areas: Missile Warning; Missile Defense; Technical Intelligence; and Battlespace Characterization. The baseline architecture for SBIRS includes space elements in Highly Elliptical Orbits (HEO), Geosynchronous Earth Orbits (GEO), and Low Earth Orbits (LEO), in addition to the following ground elements: a CONUS-based Mission Control Station (MCS) and backup (MCSB), overseas Relay Ground Stations (RGSs), Relocatable Terminals (RTs), and associated communication links. The High Component consists of four satellites in GEO, two hosted sensors in HEO (platforms provided by another organization), and associated ground elements.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

Between November 1994 and February 1995, the SBIRS Program Office developed the first Single Acquisition Management Plan (SAMP) outlining the acquisition strategy to fulfill the requirements in the SBIRS Capstone Requirements Document (CRD). The SAMP was approved on 6 Feb 95 and paved the way for the release of a Request for Proposal (RFP) to select two contractor teams for a one-year Pre-Engineering and Manufacturing Development (EMD) contract. The RFP was released on 17 Feb 95.

b. (U) Significant Developments Since Last Report --

On 4 Aug 95, SBIRS pre-EMD contracts were awarded to two prime contractor teams: Lockheed-Martin, and Hughes/TRW. Following the accomplishment of pre-EMD trades, allocation of SBIRS requirements to elements of the system, and definition of system functional requirements to elements of the system, a downselect and successful Defense Acquisition Executive (DAE) decision will allow one team to go forward into the EMD phase by 1 Oct 96.

The integrated Air Force Space Command (AFSPC)-SMC SBIRS team, in conjunction with the user community and contractors, is executing an intensive requirements closure process. The first Interim Progress Review (IPR) #1 was held from 30 Oct - 2 Nov 95 with the two SBIRS High contractor teams and Pentagon, Service, CINC, AFSPC, and SPO representatives making up the Requirements Review Group (RRG).

\*\*\* UNCLASSIFIED \*\*\*

SBIRS, December 31, 1995

7b. (U) Program Highlights (Cont'd):

During this meeting, both contractors showed they had appropriately bounded the trade space and were on track with their requirement cost versus military benefit trade process. During the IPR #2 held on 12-15 Dec 95, the contractors presented the results of the major trade studies completed to date and used the results to recommend changes to the current draft Operational Requirements Document (ORD) language. Technical Intelligence (TI), Multi-Mission capability, and Survivability requirements are the main cost drivers. However, the full range of requirements is being addressed. The interested user communities have been heavily involved in the requirements clarification discussions to date. At IPR #2, the contractors also narrowed their many design options to several basic solutions each.

The SPO has continued to refine its SBIRS acquisition strategy which, in addition to selecting the contractor with the "best" solution for EMD, will also satisfy all criteria for entry into EMD, as detailed in the Acquisition Decision Memorandum, dated 8 Feb 95. The goal is to be on contract for EMD by 1 Oct 96. An AF and OSD Integrated Process Team (IPT) kickoff meeting was held 29 Nov 95 to form working groups to update the SAMP and prepare for the DAE review scheduled for 30 Aug 96--the decision point for moving into the EMD Phase. During Dec 95, the SBIRS High acquisition strategy was briefed to the Service Acquisition Executive (SAE), who approved the downselect approach.

Congress reprogrammed \$20M from Other Procurement (3080) to RDT&E (3600) due to ground procurement requirements being deferred until FY97.

The SBIRS system is expected to satisfy the mission requirement.

c. (U) Changes Since As Of Date --

A Senior Warfighters' Conference, attended by flag officer representatives from the Air Force Space Command (AFSPC) SBIRS team and User community, met from 31 Jan-1 Feb 96 to resolve SBIRS requirements issues prior to the Jul 96 Joint Requirement Oversight Council (JROC). The major requirements issues addressed by user groups were performance, survivability, and data availability as constrained by affordability. Contractors submitted 279 suggested changes to requirements and CONOPS. The Warfighters reviewed and documented a collective perspective on proposed changes and clarifications to SBIRS requirements and will advocate service command acceptance of their consensus view. All issues were resolved for the JROC and Systems Requirement Review (SRRs). A JROC is scheduled for 16 Apr 96 to approve the USSPACECOM CRD. Another JROC is planned in Jul 96 to approve proposed AFSPC ORD changes.

\*\*\* UNCLASSIFIED \*\*\*

SBIRS, December 31, 1995

7c. (U) Program Highlights (Cont'd):

SRRs were held at Lockheed-Martin from 20-23 Feb 96, and at Hughes/TRW from 26-29 Feb 96. The contractors successfully defined and showed understanding of system requirements, their allocation and flowdown of requirements with rationale and supporting analysis, described "system-of-systems" concept architecture(s) and rationale for selection, showed supporting cost and performance analyses, and addressed technical and schedule risk. The next milestones will be System Functional Reviews (SFR) to be held in Jun 96.

8. (U) Threshold Breaches:

There are no breaches to the Air Force Acquisition Executive (AFAE) Acquisition Program Baseline (APB), dated 06 February 1995. Num-McCurdy unit cost reporting is not required for Pre-Milestone II programs, IAW Title 10, USC, Section 2433.

9. (U) Schedule:

a. (U) Milestones --

Explanation of Change:

An Integrated Baseline Review (IBR) was successfully conducted and completed on 20 Dec 95. The Contract Cost Baseline was established on 29 Sep 95. Cost information in this report is as-of 28 Jan 96 per the "Feb 96 Cost Performance Report" which shows Jan 96 fiscal month-end data. The cumulative positive cost variance is due to temporary delays in manpower usage in the System Engineering area. The cumulative negative schedule variance is due to unplanned efforts in the subcontracted Ground Assembly and Checkout design effort. The responsible subcontractor has modified their estimate at completion to stay within allocated resources. These variances will have no impact to the contract or to the program. Overall, the program is doing well. Cost is underrunning by 5%, and the schedule is within 2% of plan. The SPO anticipates no significant future cost or schedule problems for the Pre-EMD.

This is the first time this contract has been reported in the SAR.

Explanation of Change:

An Integrated Baseline Review (IBR) was successfully conducted and completed on 18 Dec 95. The Contract Cost Baseline was established on 24 Nov 95. Cost information in this report is as-of 26 Jan 96 per the "Feb 96 Cost Performance Report" which shows contractor's Jan 96 fiscal month-end data. The cumulative cost variance reflects a positive \$1.6M due to temporarily delayed effort in the Electronic Information Integrated Product Team (IPT). No other IPTs have exceeded the cumulative thresholds for either cost or schedule variance reporting. The reported variances have no impact on the contract or to the program. Overall, the program is doing well. Cost is underrunning by 3%, and the schedule is within 1% of plan. The SPO anticipates no significant future cost or schedule problems.

This is the first time this contract has been reported in the SAR.

5. (U) Related Programs:

Army TACMS Smart Submunition Warhead; Fire Direction Data Manager (FDDM); Multiple Launch Rocket System (MLRS); Improved Fire Control System M270 (IFCS); Joint Precision Strike Demonstration (JPSD); BAT; BAT Pre-Planned Product Improvement (BAT P3I); Block II; Block IIA; Advanced Field Artillery Tactical Data System (AFATDS); and a Navy Cooperative effort for Navy TACMS Advanced Technology Demonstration (ATD).

6. (U) Mission and Description:

The Army Tactical Missile System (Army TACMS/APAM) Block I is a ground-launched missile system consisting of a surface-to-surface guided missile with an anti-personnel/anti-materiel (APAM) warhead. The Improved Army TACMS (Block IA) integrates global positioning system (GPS) components and increases range of the Block I missile. The inherent GPS accuracies will be achievable independent of range. Army TACMS missiles are fired from the Multiple Launch Rocket System (MLRS) modified M270 launcher and are being deployed within the ammunition loads of corps MLRS battalions and/or division artillery MLRS batteries. Army TACMS includes: GUIDED MISSILE AND LAUNCHING ASSEMBLY TEST SET, GUIDED MISSILE SYSTEM TRAINING SET, GUIDED MISSILE SYSTEM: M165 TRAINER, TEST DEVICE, GUIDED MISSILE: M70 Modified M270 Launcher Army TACMS Missile Facilities. The Army TACMS provides a deep fires missile system that operates in near all-weather conditions, day or night. It is used to attack tactical surface-to-surface missile sites, air defense missile sites, logistics elements and command/control/communication complexes. The Block IA missile will destroy high value targets at ranges approximately twice that of the current Block I missile. The Block IA missile will be especially suited for destroying enemy surface-to-surface missile system launchers.

Army TACMS Block I replaces the conventional Lance system and the Army TACMS Block IA does not replace another defense system.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Army TACMS/APAM, December 31, 1995

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

The Army TACMS Missile System resulted from a need to engage high priority targets at ranges beyond those of existing weapons. The Required Operational Capability (ROC) was approved in May 85, and Army TACMS entered Full-Scale Development (FSD) in Mar 86. Army TACMS was successfully utilized in support of Operation Desert Shield/Desert Storm. On 2 Nov 90, Army TACMS proceeded to Milestone III, full-rate production (FRP), and its Test and Evaluation Master Plan (TEMP) was approved in Aug 91. Five follow-on production test (FFT) flights (Nos. 2-6) were completed in Sep 92. The Block I production buy was split and stretched as directed by a Strategic Systems Committee (SSC)/Conventional Systems Committee (CSC) in Feb 93, resulting in approval for the Block IA program. The FRP IV production contract was restructured to stretch out the FY 94 missile buy, adding 50 Block I missiles in FY 96, increasing the procurement program to 1647. The Block IA procurement program added an additional 800 missiles. The Block IA Program Milestone IV/II Review was conducted in Feb 94, and the Army Systems Acquisition Review Council (ASARC) approved the program for Engineering and Manufacturing Development (EMD) as well as the exit criteria for the subsequent production decision review. The 100th Army TACMS Missile, SRP-7 was launched on 9 Jun 94. On 30 Jun 94, the Principal Deputy Under Secretary of Defense directed that the Army TACMS Block I and Block IA programs be combined as an Acquisition Category (ACAT) 1C Major Defense Acquisition Program (MDAP) for reporting purposes. Testing of prototype Block IA Missiles was successfully conducted in support of the FY 94 Joint Precision Strike Demonstration (JPSD). DOD directed funding reductions and restructure, and the Army TACMS/APAM (Block IA) program was restructured to accommodate two Low-rate Initial Production (LRIP) buys instead of one as the Approved Program Baseline (APB), 8 Feb 94, initially reflected. On 11 Jan 95, a prototype Block IA missile was successfully fired at White Sands Missile Range (WSMR) in support of the Naval Surface Fire Support Advance Technology Demonstration (ATD) to demonstrate the capability to launch a modified Army TACMS missile from an M270 launcher on a sea-going platform and successfully engage a land target. The first "at-sea" launch of an Army TACMS Missile was successfully conducted on 12 Feb 95.

b. (U) Significant Developments Since Last Report --

There were 180 Block I Missiles delivered in 1995 for a sum total of 1422 Missiles. On 15-16 Feb 95, a successful hardware Critical Design Review (CDR) was conducted for the Block IA Army TACMS Missile in order to finalize the design and hardware to be used in the Improved Missile Guidance Set (IMGS) for EMD. Permission was then given to proceed with manufacturing and delivery of flight IMGS units. The Block IA EMD Hardware CDR for remaining missile components was successfully conducted, 2-3 May 95, at Loral to

Army TACMS/APAM, December 31, 1995

7b. (U) Program Highlights (Cont'd):

finalize the design of the Block IA Missile. Approval of Loral's proposed design and the commencement of manufacturing flight hardware and qualification testing was granted. The Block IA TEMP was approved by the Office of the Secretary of Defense (OSD) on 6 Mar 95. The Army TACMS/APAM APB was signed by the Army Acquisition Executive (AAE) on 24 Mar 95, and a copy was furnished to DOD. The Record of Decision, which selected WSMR as the extended range test site, was submitted to the Space and Strategic Defense Command (SSDC) Environmental Office on 8 May 95. The Software Preliminary Design Review (PDR) for the Block IA EMD Program was successfully conducted at Loral Vought, 9-10 May 95. The objectives were met and Loral was granted authorization to proceed with detailed design of Block IA software and proceed to the CDR. The Block IA LRIP and Long Leadtime Items (LLTI) Acquisition Strategy Report (ASR) was signed on 20 Dec 95. This ASR supports the procurement of 70 missiles in LRIP and the exercise of an LLTI Firm Fixed Price (FFP) option in Dec 96 to preclude a production break or the need for a second LRIP. A Letter of Offer and Acceptance for a proposed sale of Army TACMS Block I Missiles was provided to Turkiye 27 Dec 95.

Army TACMS/APAM is expected to satisfy the mission requirements.

c. (U) Changes Since As Of Date --

On 8 Feb 96, a production representative model of the Block IA Army TACMS Missile was successfully fired from McGregor Range in Fort Bliss, TX, in support of the Pre-production Test (PPT-1) Flight test. The Block IA PPT-2 Flight test is scheduled at WSMR on 7 Mar 96.

8. (U) Threshold Breaches:

There are no breaches to the approved APB, dated 24 Mar 95. There are no Nunn-McCurdy unit cost breaches.

9. (U) Schedule:

b. (U) Previous Change Explanations --

First full rate production delivery current estimate changed to reflect actual completion date. Multi-year production contract award and first multi-year production delivery current estimate changed because the Army Acquisition Executive did not approve the Multi-year Procurement Program due to inadequate cost savings when compared to annual contracts. Full-rate production-II contract award and first full-rate production-II delivery added as the Multi-year Program was not approved. Organic Support Capability - Nov 90, Depot Service Support - Jun 87, LRIP Delivery - Aug 97, were added to Feb 94 APB. DA Program Review (ASARC IIIA) - Jan 89, and First Full-Rate Production-II Delivery - Sep 92, are shown as actual dates. Funding constraints required a schedule slip in the following milestones:

LRIP II Contract award, P3I APAM production decision, Full-rate production contract award, and first FRP delivery.

\*\*\* UNCLASSIFIED \*\*\*

Army TACMS/APAM, December 31, 1995

9c. (U) Schedule (Cont'd):

c. (U) Current Change Explanations --

(Ch-1) PRODUCTION PROVE-OUT TEST - Start date changed from Jun 95 in the previous SAR to Jul 95 to reflect the actual start date. PRODUCTION PROVE-OUT TEST - Completion date changed from Jan 96 in the previous SAR to Mar 96 to reflect the estimated completion date. PRE-PRODUCTION QUALIFICATION TESTS - Start date changed from Jan 96 in the previous SAR to May 96 to reflect the actual start date. PRE-PRODUCTION QUALIFICATION TESTS - Completion date changed from Jun 96 in the previous SAR to Aug 96 to reflect the estimated completion date.

(Ch-2) BLOCK IA LRIP DECISION - from Mar 96 in the previous SAR to May 96 to reflect the estimated decision date. BLOCK IA PRODUCTION DECISION - from Oct 97 in the previous SAR to Mar 97 to reflect the favorable change in the estimated decision date. BLOCK IA FULL-RATE PRODUCTION (FRP) Contract Award - from Dec 97 in the previous SAR to Mar 97 to reflect the favorable change in the estimated award date. BLOCK IA LRIP II DELIVERY - from Jun 98 in the previous SAR to N/A to show the elimination of a second LRIP. BLOCK IA FIRST FRP DELIVERY - from May 99 in the previous SAR to May 98 to show favorable schedule change due to elimination of a second LRIP. In addition, the parameters above were changed to reflect the approved ASR that supports the 70 missile buy in FY 96 as a result of the plus-up of \$18M procurement dollars. The ASR also precludes a production break or the need for a second LRIP, and allows a 17-month leadtime for FRP I deliveries.

(Ch-3) BLOCK IA OPERATIONAL TEST & EVALUATION START DATE - Changed from Mar 96 in the previous SAR to Aug 96 due to the schedule change caused by the failure of the contractor/subcontractor to deliver a functional Embedded GPS Receiver (EGR) to be integrated into the manufactured IMGS. The first PPT flight was originally scheduled for Sep 95, but slipped to Dec 95. A change in EGR vendors has brought the program back on track, with the PPT series starting in Feb 96. Block IA OPERATIONAL TEST & EVALUATION COMPLETE DATE - Changed from Jun 96 in the previous SAR to Oct 96 due to the schedule change caused by the failure of the contractor/subcontractor to deliver a functional Embedded GPS Receiver (EGR) to be integrated into the manufactured IMGS. The first PPT flight was originally scheduled for Sep 95, but slipped to Dec 95. A change in EGR vendors has brought

b. (U) Previous Change Explanations --

RDTE

Economic: Revised escalation indices.

Engineering: Increase due to adding Blk IA P3I program.  
Correction of reported variance shown as Engineering, should be Estimating.

Estimating: Adjustment for current and prior inflation.  
Correction of reported variance shown as Engineering, should be Estimating. Revised estimate to add FY 97, and finalize Block IA efforts.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Army TACMS/APAM, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

Procurement

Economic: Revised escalation indices. Adjustment for a negative program change.  
Quantity: Increase of 800 units from 1647 to 2447.  
Schedule: Allocation due to increase of 800 units from 1647 to 2447. Stretchout of program and additional fixed costs for overhead associated with production stretchout.  
Engineering: Increase due to adding BLK IA P3I program.  
Estimating: Adjustment for current and prior inflation. Refined estimate for BAT carrier and allocation of costs increase for 800 units from 1647 to 2447. Reduction of FY 94 funds appropriated but not authorized. Adjustment for learning curve inefficiencies.  
Support: Adjustment for current and prior inflation. Increased initial spares as result of quantity increase. Increase of fielding costs. Increase of support equipment. Decreased requirements for initial spares and first destination transportation costs.

MILCON

Economic: Revised escalation indices.  
Estimating: Adjustment for current and prior inflation.

| Then Year \$                                       | 0.673                       | 0.966           | 1.014            |

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

Army TACMS is fired from the modified MLRS M270 launcher within the MLRS organizational units. Army TACMS Operating and Support (O&S) costs are included in the O&S section of the MLRS SAR and are from the Aug 95 Army TACMS Program Office Estimate. Manning/crew support is provided by the MLRS organizational unit. Army TACMS is a certified round. Maintenance determined on the basis of periodic surveillance tests taken from Aug 95 Baseline Cost Estimate.

b. (U) Costs -- None.

Sustainment Average Unit Cost for the missile is .005. There are no costs reflected for fielding.

c. (U) Contractor Support Costs -- None.

6. Mission and Description:

The V-22 Osprey is a Department of the Navy program for the purpose of developing, testing, evaluating, procuring and fielding a tilt rotor, vertical takeoff and landing aircraft for Joint Service application. The V-22 program is designed to provide an aircraft to meet the amphibious/vertical assault needs of the Marine Corps, the strike rescue needs of the Navy, and the special operations needs of the Air Force. The V-22 will replace the CH-46 and CH53A/D in the Marine Corps, and the HH-3A in the Navy, and will supplement H-53, H-60 and C-130 in the Air Force. The V-22 will be capable of flying over 2100 nautical miles with a single refueling, giving the services the advantage of a VSTOL aircraft that could rapidly self-deploy to any location in the world.

7. Program Highlights:

a. Significant Historical Developments --

Preliminary Design was initiated in April 1983 with Bell-Boeing. Allison Gas Turbine Division of General Motors Corp was selected for engine design. The V-22 program went through Milestone II (DSARC II) in April 1986 and was approved for entry into Full Scale Development on May 1, 1986, at which time the FSD contracts with Bell-Boeing and Allison were signed. First flight of aircraft #1 occurred March 29, 1989. The Secretary of Defense removed funding for the V-22 program in April 1989. Congressional action funded the program in FY90, FY91, FY92, and FY93. DT IIA and B were completed. A June 11, 1991 incident with Aircraft #5 resulted in a loss of the aircraft. On July 20, 1992, Aircraft #4 with a crew of seven crashed into the Potomac River near Quantico, Va., due to failure of a section of interconnecting drive shaft. Investigation indicated the failure was not related to tiltrotor design technology. On October 22, 1992, the FSD airframe contract was terminated. The V-22 FSD program closed out with 764 flight test hours in 645 flights. On November 18, 1994 aircraft #2 was removed from the flight test program. A letter contract was awarded to Bell-Boeing on October 22, 1992 (definitized May 1994) to begin an Engineering and Manufacturing Development Program (EMD). A letter contract was awarded to Allison on December 30, 1992 (definitized September 1993) for the associated EMD engines. A Preliminary Design Review (PDR) and a Critical Design Review (CDR) were successfully completed on April 28, 1994 and December 14, 1994, respectively. A Defense Acquisition Board (DAB)

V-22 (OSPREY), December 31, 1995

**7a. Program Highlights (Cont'd):**

review was held on September 13, 1994. An Acquisition Decision Memorandum (ADM) was signed on February 10, 1995 authorizing an integrated MV-22/CV-22 program with the Navy as the lead service.

**b. Significant Developments Since Last Report --**

The fuselage sections of aircraft #7 were successfully mated on August 1, 1995. The Acquisition Strategy Report (ASR) and the Acquisition Program Baseline Agreement (APBA) were approved on August 21, 1995. The CV-22 Phase I contract modification was awarded on August 25, 1995. The Fatigue Test Article and the Static Test Article to failure contract modification was awarded on September 11, 1995. The Test and Evaluation Master Plan (TEMP) was approved on September 28, 1995. OTIIB testing was completed in October 1995. Specification values for engine horsepower and fuel flow were achieved on October 1, 1995. All system integration labs (SIL) and the flight control systems integration rig (FCSIR) are fully populated and operational. Mating of aircraft #7 fuselage and wing was completed on December 4, 1995.

Under the Engineering and Manufacturing Development (EMD) program, the V-22 will still replace the CH-46 and CH53A/D in the Marine Corps, augment the HH-60H in the Navy, and will supplement USSOCOM aviation assets. The V-22 Osprey is expected to satisfy the mission requirement.

**c. Changes Since As Of Date --**

Commander Operational Test and Evaluation Force and Commander Air Force Operational Test and Evaluation Center completed the second V-22 operational assessment (OI-IIB) and, in the final report dated January 22, 1996, found the MV-22 (Marine Corps variant) is potentially operationally effective and potentially operationally suitable. The CV-22 (USSOCOM) configuration is also potentially operationally effective and potentially operationally suitable; however, concerns highlighted in this report with respect to CV-22 aircraft performance, terminal/objective area operations and avionics may limit its effectiveness in certain intended operating environments. The report recommended proceeding with the Advanced Acquisition Contract (AAC) and Low Rate Initial Production (LRIP). All exit criteria have been met.

**8. Threshold Breaches:**

There are no breaches to the approved Acquisition Program Baseline dated August 21, 1995. There are no Munn McCurdy unit cost breaches that are applicable to this program.

Milestone 0 through USA IOC (First Operational Company Equipped) reflects the FSD program which was terminated in April 1989.

b. Previous Change Explanations --

Production Contract award (long lead AAC) date reflects contractual agreement. Impact of production termination, 19 Apr 89. Army milestones no longer applicable. OTIHA added back into the schedule. Schedule milestones remain "not applicable" for future schedule milestones due to production termination.

c. Current Change Explanations --

(Ch-1) Milestones were added to reflect the approved Acquisition Program Baseline dated August 21, 1995.

Performance characteristics for Folded Length through External Cargo (lbs) reflects the program which was terminated in 1989. The current EMD contract specifications do not include the USSOCOM requirements.

b. Previous Change Explanations --

Impact of production program termination. "Not applicables" reflect the termination of production.

c. Current Change Explanations --

(Ch-1) The V-22 Osprey characteristics were added to reflect the approved Acquisition Program Baseline dated August 21, 1995.

(Ch-2) These performance characteristics represent the EMD Amphibious Troops Lift, EMD Amphibious Ext Lift, EMD Land Assault Troop Lift, EMD Land Assault Ext Lift, EMD Special Operations/Special Warfare, EMD Airspeed, and EMD Mission Capable Rate. They were renamed in the approved Acquisition Program Baseline dated August 21, 1995.

d. References --

Development Estimate:  
FY 1988/89 President's Budget.

Approved Program:  
Approved Acquisition Program Baseline dated August 21, 1995.

b. Previous Change Explanations --

RD&E

Economic: Revised escalation rates offset by impact of program funding termination and adjustment for negative program change.

Quantity: Impact of program funding termination. FY91 Congressional appropriation.

Schedule: Air Force simulator modification rescheduled one year.

Engineering: Air Force deletion of IDADS and addition of EW analysis offset by impact of program funding termination.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

V-22 (OSPREY), December 31, 1995

**13b. Cost Variance Analysis (Cont'd):**

**Estimating:** Reprogrammings, budget adjustments, reprice of Air Force ECP offset by program funding termination. SBIR assessment. Contract price escalation clause adjustment and correction of error. Air Force transfer within program element. Congressional appropriation of FY92 funds and accounting adjustments. Termination of FSD airframe contract, PBD707, and dascope of ENSIP effort on engine contract. Rephasing of EMD efforts and inclusion of NV-22 EMD efforts and USSOCOM unique RDT&E requirements. Rephase and adjustments for CV-22, EMD Airframe contract definitization, Fatigue Test Article, Static Test Article to failure, COEA, risk assessment/reduction, Congressional undistributed reductions.

**Procurement**

**Economic:** Revised escalation rates offset by impact of program funding termination.

**Quantity:** Army withdrawal, Air Force reduction in quantity offset by impact of program funding termination. Total program quantity increase from 0 to 523.

**Schedule:** Navy and Air Force rephase buy schedule offset by impact of program funding termination.

**Estimating:** Reprice to reflect lower quantities, CFE to CFE changes, and tooling refinements offset by impact of program funding termination. Congressional appropriation of advanced procurement. Congressional reprogramming from APN to R&D. General reprogramming and budget adjustments. Reprogramming to other Navy programs and expired funds. Impact of termination of FSD contract. Inflation offsets.

**Support:** Army withdrawal and impact of program funding termination. Navy and Air Force increases associated with quantity increase.

**MILCON**

**Economic:** Revised escalation rates offset by impact of program funding termination.

**Schedule:** Air Force rephase of facilities offset by impact of program funding termination.

**Estimating:** Estimating refinements and impact of program funding termination, and adjustments for current and prior year inflation. Addition of operational sites due to quantity increase.

| Cumulative Variances To Date (12/31/95) | \$-3.2        | \$-4.1            |
| Net Change                              | \$2.1         | \$-0.8            |

Explanation of Change:

Unfavorable cost variance improved slightly due to completion of some tests for less than the amount planned. Testing is the area with the greatest cost growth to date, primarily because of subcontractor problems with the coupling vendor.

Unfavorable schedule variance deteriorated slightly because of several hardware failures experienced during testing. Testing is the primary area behind schedule.

| Initial Contract Price |         |     |

Explanation of Change:

Unfavorable cost variance worsened slightly due to higher tooling fabrication and design costs, rework, and subcontract cost growth in avionics, systems, and systems and integrated wiring systems areas. Systems, systems and integrated wiring systems, center fuselage, and forward fuselage are the areas with the largest cost growth to date.

Unfavorable schedule variance deteriorated primarily because of auxiliary power unit problems in the propulsion element, and advanced mission computer delays in the avionics element. The propulsion, avionics, systems, and systems and integrated wiring systems areas have the most unfavorable schedule variances to date.

Explanation of Change:

Cost variance worsened due to greater than anticipated costs for design and development hardware, additional labor cost associated with the late delivery of material and test delays, and increased labor rates.

Unfavorable schedule variance deteriorated due to problems in the

| Procurement | 0/0                |

Of the 6 aircraft ordered and delivered under the FSD airframe contract, only 2 aircraft remain. Of those 2 aircraft, 1 is in permanent storage and 1 is still being flown as part of the test program at Patuxent River, MD.

This program is pre-Milestone III and no full-rate production baseline has been determined.

b. Approved Design-to-Cost Objective -- N/A.

18. Operating and Support Costs:

a. Assumptions and Ground Rules --

An Operating and Support Cost estimate for the V-22 is currently being developed for reporting to the Cost Analysis Improvement Group (CAIG) in November 1996 and will be reported in the next SAR.

b. Costs -- None.

c. Contractor Support Costs -- None.

Chem Demil, December 31, 1995

**6. Mission and Description (Cont'd):**

Chemical Materiel Project (NSCMP), the Chemical Stockpile Emergency Preparedness Project (CSEPP), and the Alternative Technologies and Approaches Project (ATAP). The primary mission to be accomplished under the CSDP is the demilitarization of the United States unitary stockpile of lethal chemical agents and munitions stored at eight locations in the continental United States, and Johnston Atoll (JA) in the Pacific. The current or baseline program plan uses a reverse-assembly process to separate the components of the chemical weapons followed by the incineration of each component. Efforts to be accomplished under the NSCMP are the identification of locations, types, and quantities of non-stockpile chemical materiel (NSCM); development and implementation of transportation and destruction methods and procedures; and development of schedules, plans, and cost estimates to implement the project. NSCM includes suspected buried chemical materiel; recovered chemical materiel; former chemical weapons production facilities; binary chemical weapons; and miscellaneous chemical warfare materiel (CWM). The CSEPP is an effort complementary to the CSDP to enhance protection of the civilian population, the workers involved in the destruction effort, and the environment during storage activities, and destruction of the United States' chemical weapons stockpile. The Army has the lead in the CSEPP to provide emergency response/preparedness to the communities surrounding the eight continental United States storage sites. The Federal Emergency Management Agency (FEMA) participates in this project by providing technical emergency preparedness assistance, as well as a financial structure for transferring funds to the states and counties. A separate Product Manager for Alternative Technologies and Approaches was established during 1995 with responsibility for identifying alternative technologies project requirements and alternative approaches, planning for the implementation of the requirements, and managing the activities of the various organizations involved.

**7. Program Highlights:**

**a. Significant Historical Developments --**

The concept plan for the Chemical Stockpile Disposal Project (CSDP) was submitted to Congress in 1986. In 1988, the Final Programmatic Environmental Impact Statement for the program was completed. Also, the Record of Decision (ROD) and the CSDP Implementation Plan were finalized and submitted to Congress. The Army selected on-site disposal, using reverse assembly/incineration (baseline process) to destroy the chemical weapons stockpile. The National Research Council (NRC), under the auspices of the National Academy of Sciences, was selected as an independent group to provide oversight to the Chemical Demilitarization (Chem Demil) Program.

In 1988, construction activities at the Johnston Atoll Chemical

\*\*\* UNCLASSIFIED \*\*\*

Chem Demil, December 31, 1995

**7a. Program Highlights (Cont'd):**

Agent Disposal System (JACADS) were completed and systemization started. In 1989, construction of the first continental United States disposal facility at Tooele Army Depot, Utah was initiated. The destruction of the entire stockpile of BZ (nerve agent) at Pine Bluff Arsenal, Arkansas was completed in 1989.

In 1990, the successful retrograde of all chemical munitions stored in Germany to the storage facilities at Johnston Atoll (JA) was accomplished. Congress directed that the Army conduct and successfully complete Operational Verification Testing (OVT) at JACADS prior to initiating testing at the follow-on-sites in the continental U.S. A four-phase OVT campaign was conducted from Jul 90 until Mar 93. In Aug 93, the Secretary of Defense provided certification to Congress that the Army had successfully completed OVT at JACADS, and systemization at the recently completed Tooele facility commenced in Sep 93.

In 1992, Congress directed that the Army use an alternative technology to destroy the chemical stockpile at the low volume sites if the Secretary of the Army's evaluation (based upon the NRC's recommendation) is that the alternative technology is significantly safer, equally or more cost effective, and could destroy the stockpile at these sites by 31 Dec 04. The sites which are being considered for use of this technology are Aberdeen Proving Ground, Maryland and Newport Army Ammunition Plant, Indiana.

In Nov 93, an Interim Survey and Analysis Report, which projected the scope and a rough-order-of-magnitude cost estimate for the Non-Stockpile Chemical Material Project (NSCMP) was published and provided to Congress.

Full-scale disposal operations, commenced at JACADS in Jan 94. The first campaign was GB (nerve agent) filled M55 rockets.

The NRC Committee on Review and Evaluation of the Army Chemical Stockpile Disposal Project (the Stockpile Committee) provided its report, "Recommendations for the Disposal of Chemical Agents and Munitions" to the Army in Feb 94. Based upon the Army's evaluation of the NRC report, a Research & Development (R&D) program on two low-temperature/low pressure alternative technologies (stand-alone neutralization and neutralization followed by biodegradation) was initiated in Aug 94.

**b. Significant Developments Since Last Report --**

The Defense Acquisition Board (DAB) conducted a review of the program in Mar 95 to assess the status of the Chemical Stockpile Disposal Project (CSDP) and the Non-Stockpile Chemical Materiel

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Chem Demil, December 31, 1995

**7b. Program Highlights (Cont'd):**

Project (NSCMP) and to make specific recommendations regarding program management. The Board recommended the approval of the Acquisition Program Baseline (APB). As a result, the Defense Acquisition Executive approved the APB.

Several events have occurred that affected the CSDP schedule. Longer than anticipated review periods for the Tooele Chemical Agent Disposal Facility (TOCDF) environmental permit modifications, Facility Construction Certifications, and completion of a Health Risk Assessment by the Utah Department of Environmental Quality have delayed the projected start of toxic operations from 4Q FY 95 until 3Q FY 96. In addition, the Anniston Chemical Agent Disposal Facility (ANCDF) systems contract award date was delayed from 4Q FY 95 until 2Q FY 96 with a "limited notice to proceed" provision. This allows construction planning, permit processing, and preparation for construction to begin. The Alabama Department of Environmental Management is not expected to make its decision on issuing environmental permits until 4Q FY 96 allowing construction to commence.

During 1995, public outreach efforts focused on a proactive public affairs approach. The goal of this effort is to identify concerns and issues; devise methods for effectively establishing and maintaining dialogues; seek public input; and explain information in a matter that is easily understood. A Public Outreach Office was opened in Jun 95 in Tooele, Utah and a second opened in Dec 95 in Anniston, Alabama.

In Dec 95, the Secretary of Defense provided certification to Congress that Johnston Atoll Chemical Agent Disposal System (JACADS) had satisfied the requirements of Section 2106 of Public Law 103-160, effective 20 Feb 95. JACADS demonstrated six months of successful operations while meeting all environmental and safety standards. The facility demonstrated that the process is operationally effective and the Secretary certified that the Army has scheduled award of another non-low volume site systems contract.

JACADS surpassed the "one-million pounds of lethal chemical agent destroyed" mark and completed the destruction of all M55 rockets in its stockpile during 1995. Final daily processing rates exceeded the established goals. The GB (nerve-agent) filled 750 pound bomb campaign was completed on 26 Nov 95 approximately 4 months ahead of schedule.

Systemization testing is nearly complete at TOCDF. The operation shake-down period is scheduled to begin 3Q FY 96. The execution of the required environmental documentation and trial burns continues.

**7b. Program Highlights (Cont'd):**

Two of the required regulatory surrogate trial burns were completed this year in the Liquid Incinerator and Deactivation Furnace System (DFS). Also, the Toxic Substance Control Act (TSCA) R&D test burn in the DFS was completed during this time period.

The NSCMP published an Implementation Plan in Aug 95, which addresses the details of the planned disposal methods and the proposed schedules necessary for compliance with the Chemical Weapons Convention. The Small Burials Contract for the NSCMP was awarded in Jun 95.

The Army and the Federal Emergency Management Agency (FEMA) formed an integrated Chemical Stockpile Emergency Preparedness Project (CSEPP) Core Team to manage project integration and execution. The Team developed a revised Life Cycle Cost Estimate and the project was baselined during 1995.

The Product Manager for Alternative Technologies and Approaches Project (ATAP) identified two neutralization-based processes, stand alone neutralization and neutralization followed by biodegradation. These processes are currently in laboratory and bench-scale testing and evaluation for use with HD (mustard agent) and VX (nerve agent). Three additional promising alternative technologies have been identified from industry's response to a recently published Commerce Business Daily announcement. These technologies, electrochemical oxidation, high temperature gas phase reduction, and the catalytic extraction process, as well as the two neutralization-based processes, will be evaluated by the National Research Council (NRC).

The Chem Demil Program is expected to satisfy mission requirements.

**c. Changes Since As Of Date --**

JACADS completed the GB (nerve agent) filled 500 pound bomb campaign on 7 Feb 96. Over two million pounds of chemical agent have been destroyed at JACADS. This represents over 50% of the agent stored on Johnston Atoll. Changeover efforts are underway for the GB 155mm projectile campaign. Processing of these projectiles is scheduled to commence in 3Q FY 96.

The systems contract for ANCDF was awarded on 29 Feb 96 to Westinghouse Electric Company of Pittsburgh, PA with a "limited notice to proceed" provision.

An Overarching Integrated Product Team (OIPT) meeting was held on 26 Feb 96 to review the program's cost position (excluding NSCMP). The Defense Acquisition Board (DAB) Readiness Meeting was held on 4 Mar 96 and resulted in the cancellation of the DAB scheduled for 11 Mar

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Chem Demil, December 31, 1995

7c. Program Highlights (Cont'd):

96. The Cost Analysis Improvement Group (CAIG) concurred with the Army cost position (current estimate) for the CSDP of \$12.4B (including CSEPP and ATAP) which was validated by independent estimates and was deemed reasonable but unaffordable based on current DoD funding levels. The results of the DAB Readiness Meeting included directing the Army to submit initial cost reduction initiatives in Jun 96 followed by an update report to the OIPT in Aug 96. These issues will be addressed during the FY98-FY03 budget reviews. The Army's report of the NRC's study of alternative technologies will be presented to the OIPT in Oct 96. It was also agreed to continue Selected Acquisition Report (SAR) reporting against the approved APB in accordance with Department of Defense (DoD) SAR policy. The Program Manager (PM) will prepare a revised schedule which will be used for reporting against schedule and performance pending completion of the Department's program and budget deliberations and approval of the revised APB at the next DAB currently planned for Mar 97. The Army, with input from the Deputy Under Secretary of Defense (Environmental Security), shall develop a critical path for an environmental permit schedule and assess environmental resource requirements.

8. Threshold Breaches:

There are schedule breaches to the approved Acquisition Program Baseline (APB) dated 29 Mar 95. Program Deviation Reports and a revised APB have been submitted. There are no Nunn-McCurdy Unit Cost breaches.

CSDP - Delays in receiving approved environmental permits from the States of Utah and Alabama have slipped the start of operations (agent shakedown) at the Tooele disposal facility, construction start at the Anniston disposal facility, and award of the systems contract at the Pine Bluff disposal facility. The estimated length of the systemization phase at the seven remaining chemical facilities has increased by four months and the estimated projectile processing rate has decreased by 25%. These changes will cause schedule breaches at Tooele, Anniston, Umatilla and Pueblo. The Pine Bluff breaches are the result of the cumulative effects of the systems contract award delay and the extension to systemization.

CSEPP - The CSDP schedule extension for systemization will cause breaches of the Pre-Operational/Annual Exercise milestones for ANCDF, PUCDF, and Newport Chemical Agent Disposal Facility (NECDF). We anticipate no unfavorable cost, schedule or performance impact to the program due to these breaches since exercises occur annually and only the exercise prior to the start of operations is designated as the milestone event.

\*\*\* UNCLASSIFIED \*\*\*

Chem Demil, December 31, 1995

8. Threshold Breaches (Cont'd):

NSCMP - Although the Rapid Response System Prototype permit application was submitted on time, we do not expect to receive approval within schedule thresholds which will delay the start of Concept Demonstration. The current PM's estimate is Oct 96.

Chem Demil, December 31, 1995

9a. Schedule (Cont'd):

CSDP

JACADS - Johnston Atoll Chemical Agent Disposal System  
T&E - Test and Evaluation  
TOCDF - Tooele Chemical Agent Disposal Facility  
ANCDF - Anniston Chemical Agent Disposal Facility  
UMCDF - Umatilla Chemical Agent Disposal Facility  
PBCDF - Pine Bluff Chemical Agent Disposal Facility  
PUCDF - Pueblo Chemical Agent Disposal Facility  
BGCDF - Blue Grass Chemical Agent Disposal Facility  
ABCDF - Aberdeen Chemical Agent Disposal Facility  
NECDF - Newport Chemical Agent Disposal Facility

Note 1: Principal Pre-Operational Readiness Process Activities include:

CSEPP  
Safety/Surety/Occupational Health  
Training  
Systemization Oversight Review  
Acceptance T&E Report Review  
Review of Final Environmental Approvals  
Plant Operations Preparation

Note 2: Facilities constructed to carry out chemical demilitarization may not be used for any purpose other than the destruction of lethal chemical agents and munitions, and when no longer needed to carry out this mission, such facilities shall be cleaned, dismantled, and disposed of in accordance with applicable laws and regulations.

b. Previous Change Explanations -- None

c. Current Change Explanations --

(Ch-1) - The PM's current estimate for the JACADS "Begin Closure" milestone is currently ahead of the APB schedule date (the PM's Current Estimate has changed from Mar 00 to Nov 99). Contributing factors to a possible early closure are successful processing rates which have exceeded established goals and the completion of the 750 pound bomb campaign approximately 4 months ahead of schedule.

(Ch-2) - The following milestones have changed due to delays in receiving approval of environmental permits from their respective states:

| MILESTONES                         | 1994 SAR<br>EST. | 1995 SAR<br>CURRENT EST. |
|------------------------------------|------------------|--------------------------|
| TOOELE (TOCDF)<br>Begin Operations | Sep 95           | May 96                   |

- 9 -

9c. Schedule (Cont'd):  
CSDP

|                    |        |        |
|--------------------|--------|--------|
| ANNISTON (ANCDF)   |        |        |
| Systems Contract   | Aug 95 | Feb 96 |
| Award/Start Const. |        |        |

|   |        |        |
|---|--------|--------|
| UMATILLA (UMCDF)                                |        |        |
| Submit Updated RCRA/<br>CAA Permit Applications | Mar 95 | Sep 95 |
| Systems Contract Award/<br>Start Const.         | Mar 96 | Sep 96 |

(Ch-3) - The following milestones have changed due to the aforementioned delays (Ch-2) which have caused a ripple effect in meeting follow-on milestones for these following sites. The schedules have also been impacted by a 4 month extension to the systemization phase and the reduction of the planning estimates of the projectile processing rate by an additional 25% from the current baseline.

| MILESTONES                   | 1994 SAR<br>EST. | 1995 SAR<br>CURRENT EST. |

CSDP

NEWPORT (NECDF)

|                  |        |        |
|------------------|--------|--------|
| Begin Operations | Jun 03 | Oct 03 |
| Begin Closure    | Apr 04 | Jun 04 |

(Ch-4) - The following milestones have changed due to delays in receiving approved environmental permits (see revised systemization schedule).

(Ch-5) - The planned submission of the BGCDF RCRA/CAA Permit Application has slipped from Sep 95 to Dec 95.

(Ch-6) - The planned submission of the ABCDF RCRA/CAA Permit Application has slipped from Jul 96 to Nov 96. The PM plans to delay submitting permit applications until the DAB review for Alternative Technologies Approaches Project has occurred.

Note 1: Each site will be exercised on an annual basis in the month agreed upon by the Army and State. Plans and training were completed at each site by Dec 92.

Note 2: The Pre-Operational Annual Exercise ("Pre-Op/Annual Exercise") is defined as the last annual exercise prior to initiating chemical demilitarization operations. Medical preparedness will occur and be evaluated prior to the pre-operational annual exercise.

9b. Schedule (Cont'd):  
CSEPP

b. Previous Change Explanations -- None

c. Current Change Explanations --

(Ch-1) The following milestones have changed due to extensions in the systemization phase. As a result, the Pre-Operational Annual Exercises at Anniston, Pueblo, and Newport have been delayed one year. These are technically breaches since there are no cost, schedule or performance impacts to the program. Exercises occur annually and only the exercise in the year prior to start of operations is designated as the milestone event.

| MILESTONES             | 1994 SAR<br>EST. | 1995 SAR<br>CURRENT EST. |
|------------------------|------------------|--------------------------|
| ANNISTON (ANCDF)       |                  |                          |
| Pre-Op/Annual Exercise | Mar 99           | Mar 00                   |
| PUEBLO (PUCDF)         |                  |                          |
| Pre-Op/Annual Exercise | Aug 00           | Aug 01                   |
| NEWPORT (NECDF)        |                  |                          |
| Pre-Op/Annual Exercise | Jun 02           | Jun 03                   |

Note 1: Performance - The Non-Stockpile Chemical Materiel Project (NSCMP) demonstration of chemical destruction concepts (Munitions Management Devices and Rapid Response System) will identify specific technical performance parameters for each.

Note 2: Schedule - Parameters will be defined once the Chemical Weapons Convention (CWC) has been ratified by the U.S. and enters into force (EIF). The chemical destruction systems are required to comply with the CWC after EIF and to address risk to public health and the environment due to chemical warfare materiel recovered at formerly used defense sites and active installations.

Note 3: Cost - Parameters are estimates that include prior year plus the FY96-05 planning cycle. Costs include CWC mandates but not chemical materiel buried before 01 Jan 77. Such buried materiel is not required to be destroyed under the CWC until recovered. The recovery and destruction of such buried items may be accomplished under the Defense Environmental Restoration Program. These costs will be defined as the ORD/BCE/ICE are developed, then updated in the APB.

NSCMP

b. Previous Change Explanations -- None

c. Current Change Explanations --

(Ch-1) - The receipt of the HQDA Safety Approval of the Waste Characterization was delayed from Aug 95 to Jan 96 because required neutralization chemistry was not complete. Sufficient data was available in Nov 95 to submit the request in Dec 95, and to receive the HQDA approval in Jan 96.

(Ch-2) - The following milestones have changed because of anticipated delays in receiving permits from the State of Utah.

| MILESTONES                           | 1994 SAR<br>EST. | 1995 SAR<br>CURRENT EST. |
|--------------------------------------|------------------|--------------------------|
| MUNITIONS MANAGEMENT                 |                  |                          |
| DEVICE PROTOTYPE (w/o<br>Energetics) |                  |                          |
| Submit Permit Application            | Sep 95           | Nov 95                   |
| Obtain Environmental Permit          | May 96           | Oct 96                   |
| RAPID RESPONSE SYSTEM PROTOTYPE      |                  |                          |
| Obtain Environmental Permit          | Jan 96           | Oct 96                   |
| Complete Concept Demonstration       | Apr 96           | Feb 97                   |

(Ch-3) - The permit application for the Rapid Response System Prototype was submitted in Jul 95 earlier than the original estimate of Aug 95.

Acronyms - in order of appearance:

DFS - Deactivation Furnace System  
GB - Nerve Chemical Agent  
H/HD - Mustard Blister Chemical Agent  
LIC - Liquid Incinerator  
mm - millimeter  
PCB - Polychlorinated Biphenyl  
POHC - Principal Organic Hazardous Constituent  
VX - Nerve Chemical Agent  
lb - Pound  
mg/m<sup>3</sup> - milligram per cubic meter

Note 1: The demonstrated rates are from the individual demilitarization machine capacity runs and do not include processing in the furnaces. Furnace capacity is demonstrated during the execution of the surrogate trial burns. For TOCDF, successful surrogate trial burns have been completed in the systems required for rocket processing (both LICs and the DFS). Mine processing requires replacement of equipment in the facility and is not conducted during systemization. Munitions listed as "N/A" are not stored at Tooele; these munitions will be demonstrated at other CONUS stockpile sites. The overall evaluation of the systemization experience is being finalized between PMCD and U.S. Army Materiel Systems Analysis Activity (AMSAA). Once that evaluation is completed, these numbers will be updated to be consistent with the evaluation results.

Note 2: "Meets environmental laws and regulations" means the facility is operating in compliance with all the conditions specified in environmental permits and applicable laws and regulations. The threshold is breached if violation warrants a stop work order.

Note 3. "Meets safety and occupational health laws and regulations" means the facility is operating in compliance with the conditions specified in safety and occupational health laws and regulations. The threshold is breached if violation warrants a stop-work order.

**10a. Performance Characteristics (Cont'd):**

CSDP

Note 4: The term chemical agent release is defined as an event involving:

a. Confirmed agent release outside engineering controls and above the general population limits as measured at a perimeter monitoring station with the disposal facility as the identified source. The general population limits are:

GB - 0.000003 mg/m<sup>3</sup>  
VX - 0.000003 mg/m<sup>3</sup>  
H/HD - 0.0001 mg/m<sup>3</sup>

b. Confirmed point source (stack) agent release above the allowable stack concentration (ASC). The ASC values are:

GB - 0.0003 mg/m<sup>3</sup>  
VX - 0.0003 mg/m<sup>3</sup>  
H/HD - 0.03 mg/m<sup>3</sup>

Note 5: A chemical agent exposure refers to an individual exhibiting clinical signs or symptoms of being exposed to chemical agent.

Note 6: Incinerator Performance is defined as the demonstration of POHC and PCB destruction and removal efficiency during trial burns. Incinerator operational conditions are recorded during all incineration activities. Measurements of other incinerator emissions are generally required by permits, but these measurements are typically not limited to just during trial burns and when the incinerator is operating at maximum capacity. For example, emissions monitoring of agent is a continuous requirement regardless of throughput rate.

Note 7: Threshold values represent start-up rate demonstrated during systemization eight-hour capacity run. Objective values represent the average full-rate utilized in the calculation of schedule duration.

Acronyms -

ADP - Automatic Data Processing  
A&N - Alert & Notification  
IRZ - Immediate Response Zone  
mbs - megabytes per second  
kbs - kilobytes per second  
Mux - Multiplex  
dBc - Decibel C - weighted network  
cov - coverage

Note 1: The CSEPP applies to the four aspects of storage, transport, demilitarization, and non-stockpile efforts pertaining to chemical munitions and facilities. Funding for emergency equipment is provided to the States. The requirements for communications, ADP, sirens and tone alert radios are the benchmarks provided to the states for equipment purchases. All required equipment is commercial off-the-shelf and each state is responsible for purchase and installation IAW state laws and regulations.

Note 2: The time (minutes) it takes on-post personnel to notify the off-post officials of an incident on post (10 minutes time at PUDA, UMDA, and TEAD are based on distance to the population density).

Note 3: The time (minutes) it takes off-post officials to alert and notify the public of an incident on post.

Note 4: Each site will be exercised on an annual basis in the month agreed upon by the Army and State. Plans and training were completed at each site by Dec 92.

Note 5: The Pre-Operational Annual Exercise ("Pre-Op/Annual Exercise") is defined as the last annual exercise prior to initiating chemical demilitarization operations. Medical Preparedness will occur and be evaluated prior to the Pre-Operational Annual exercise.

Note 1: Performance - The Non-Stockpile Chemical Materiel Project (NSCMP) demonstration of chemical destruction concepts (Munitions Management Devices and Rapid Response System) will identify specific technical performance parameters for each.

Note 2: Schedule - Parameters will be defined once the Chemical Weapons Convention (CWC) has been ratified by the U.S. and enters into force (EIF). The chemical destruction systems are required to comply with the CWC after EIF and to address risk to public health and the environment due to chemical warfare materiel recovered at formerly used defense sites and active installations.

Note 3: Cost - Parameters are estimates that include prior year

Explanation of Change:

Note: This contract is funded with Procurement, Operation and Maintenance, and Military Construction funds.

The unfavorable Cost Variance reflects effort which is associated

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Chem Demil, December 31, 1995

**13. Contract Information (Cont'd):**

with final negotiations for the Construction phase and continuing schedule extensions incurred during the Systemization phase. Increases in the unfavorable Cost Variance reflect continuing delays in obtaining environmental permit approvals to start agent shakedown operations. Delays in approval of permit modifications and approval to execute required test activities continue to drive the projected start of agent operations.

The favorable Schedule Variance reflects the current status of EG&G. The State of Utah must approve the Health Risk Assessment which is necessary to start agent operations. The project anticipates receiving approval to start operations 3Q FY 96. This is a breach of the APB date for the start of agent operations. A Program Deviation Report was prepared and forwarded to DA in Jan 96. The PMCD is working closely with the State of Utah to work the required actions to obtain final approval to begin operations at TOCDF. PMCD will continue to work to minimize overall schedule drivers.

The PM's Estimated Cost is based on current negotiated scope including the first year of agent operations.

Humphreys and Associates is currently under contract to assist EG&G in the implementation of C/SCSC. EG&G's final validation is scheduled for 4Q FY 96. This schedule includes three months of actual field use prior to validation.

Explanation of Change: None.

This contract covers procurement of equipment for the demilitarization facilities at eight sites: TOCDF, ANCDF, UMCDF, PBCDF, PUCDF, BGCDF, ABCDF, NECDF, and the Chem Demil Training Facility (CDTF).

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Chem Demil, December 31, 1995

15. Contract Information (Cont'd):

The initial contract was awarded and the original contract price was negotiated to cover the procurement of necessary equipment for all eight sites plus the CDTF; however, it was funded at a much lower level to only cover the equipment for Tooele and the CDTF. The original contract price includes only firm work to be performed and does not include options that may or may not be exercised.

Since the contract is incrementally funded each year to support the programmatic schedule and the construction requirements at each location, the current contract price reflects only the funds that have been placed on the contract to date. They include the management and passthrough costs associated with procuring equipment for Tooele, CDTF, Anniston, and partial funding for the management and passthrough costs for procuring the long lead equipment for Umatilla, Pine Bluff, and Pueblo. The current contract price does not include the full costs for procuring all the equipment necessary to build all sites.

The Contractor's estimate at completion represents what is currently on contract. If equipment is ordered to complete construction of all nine facilities, the contractor's estimate at completion remains \$677.0M.

Explanation of Change: None.

The design engineering contract includes all eight CONUS demilitarization facilities: TOCDF, ANCDF, UMCDF, PBCDF, PBCDF, BGCDF, ABCDF, NECDF, and the CDTF. Initial contract award amount only included criteria development efforts; no design work was initially awarded. Design work is complete for two sites and is underway for six sites. Post-design support has been completed for

\*\*\* UNCLASSIFIED \*\*\*

Chem Demil, December 31, 1995

15. Contract Information (Cont'd):

one site and is underway one additional site.

The current contract price reflects contract modifications necessary to implement ECPs arising from lessons learned at Johnston Atoll (JA) and Tooele. As of 1 Mar 96, the contract has 136 modifications.

This contract is incrementally funded with only certain tasks under the contract being authorized for each fiscal year. Contract figures include Military Construction, Procurement, and O&M funds.

The contractor's and PM's estimate at completion are based on work currently on contract. However, the anticipated final cost of this contract to finish the design work for all nine sites is shown in the PM's Life Cycle Cost Estimate. This additional work is not on contract, and is not reported here so as not to jeopardize future negotiations.

The reasons for cost growth on this contract reported in the original SAR remain valid and are repeated for convenience:

- Contract is incrementally funded each year.
- The contract completion date has changed from 1994 to 2003.
- Original contract was based on copying the JACADS design for each CONUS site whereas site-specific designs are now required.
- Lessons learned are being incorporated into all designs.
- There is significant work due to environmental and safety requirements which were not recognized in the original contract.

Chem Demil, December 31, 1995

15. Contract Information (Cont'd):

This contract covers procurement of equipment for the incineration facilities at nine sites: JACADS, TOCDF, ANCDF, UMCDF, PBCDF, PUCDF, BGCDF, ABCDF, NECDF, and the CDTF.

This contract is incrementally funded each year, and equipment is procured to support annual construction requirements at each location. The initial contract was awarded to cover the procurement and installation of equipment for JACADS. Subsequent modifications have been made to complete the procurement of equipment for JACADS, TOCDF and the CDTF, as well as to order long lead time equipment for ANCDF, UMCDF, PBCDF, and PUCDF. However, the current contract price does not cover the full costs for all the equipment necessary to build these additional sites.

The Contractor's estimate at completion represents what is currently on contract. If equipment is ordered to complete construction of all ten facilities, the contractor's estimate at completion remains \$474.0M.

Explanation of Change:

The contractor continues to perform tasks below cost and is decreasing the schedule variance. The current favorable cost and schedule variances are expected to continue.

Estimated Completion Date represents the date on which this contract expires Sep 96. Upon expiration, a new contract will be competitively awarded for continuation of training. This contract is over 90.4% complete and will no longer be reported in the SAR.

Explanation of Change: None.

Note: This contract is funded with Procurement, Operation and Maintenance, and Military Construction funds.

Initial contract price was to destroy the M55 rockets at JA. The current contract includes Operational Verification Testing (OVT) and subsequent demil campaigns within the period of performance. The follow-on contract will encompass additional demil campaigns necessary to complete the destruction of the JA chemical weapons stockpile.

This is an incrementally funded and negotiated contract and will continue to be during the O&M Phase.

Current contract ends on 26 Aug 96. Follow on contract (RE&C's Est. of \$510M for 5 years to end FY 01) in final negotiation stages. Authorization to proceed with identified pre-contract activities was issued (NTE \$100K). Follow-on contract has imposed Cost/Schedule Control System Criteria on the system contractor, and implementation activities were included in the pre-contract award.

There are recurring fly-away dollars for years with no quantities due to the complexity of the program and the length of time it takes to procure a demilitarization facility.

LHD - 1, December 31, 1995

5. (U) Related Programs:

Landing Craft, Air Cushion (LCAC)

6. (U) Mission and Description:

The ships primary amphibious mission is to embark, deploy and land elements of a Marine landing force in an assault by helicopters, landing craft amphibious vehicles, and by combinations of these methods. LHD 1 Class has a secondary/convertible mission for sea control and power projection. The LHD is a modification of the LHA Class design, with significant upgrades in combat systems, medical spaces, chemical biological radiological defense, aviation ordnance handling, and landing craft handling capabilities. The LHD will partially offset the loss in lift capacity resulting from block retirements of aging amphibious ships in the 1990's.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

The LHD Program began in FY 1981 as part of an overall program to address impending block obsolescence of the Navy's amphibious lift capability. In June 1981, SECNAV proposed that the LHD have a convertible sea control mission; and, in November, directed that the Program be a modified LHA design.

A sole-source detail design and construction contract was awarded to Ingalls Shipbuilding Incorporated (ISI) in February 1984 for LHD 1. The ship was delivered in May 1989.

A competitive contract for LHD 2, with options for LHD 3 and 4 was awarded to ISI in September 1986. The options for LHD 3 and 4 were exercised November 1987 and October 1988, respectively. LHD 2, 3 and 4 were delivered to the Navy July 1992, August 1993 and November 1994, respectively.

A competitive contract for the LHD 5, with unevaluated and undefinitized options for LHD 6 and 7, was awarded to ISI in December 1991 and construction began 25 July 1994.

b. (U) Significant Developments Since Last Report --

LHD 4 was commissioned 11 February 1995 and Final Contract Trials were completed 28 July 1995. LHD 6 Keel Laying Ceremony was held on 18 April 1995. A contract option for LHD 7 was awarded to ISI on 28 December 1995.

The LHD 1 Program has been shown to satisfy the mission requirement.

c. (U) Changes Since As Of Date -- None.

| Naval Support Date                 | MAY 90                         | MAR 93                     | MAR 93                     |
| IOC                                | MAY 90                         | MAY 90                     | NOV 90                     |

IOC - Reflects date the lead ship is ready for operational deployment.

b. (U) Previous Change Explanations --

Actual contract award was Feb 1984. Initial Builders Trials (BT) were not fully successful causing a six week delay in delivery. Due to late receipt of Provisioning Technical Documentation, the Material Support Date (MSD) was rescheduled to Jul 89 and Naval Support Date (NSD) was rescheduled to Oct 90. NSD was also extended to Mar 93 based on lack of support for 11 Shipbuilder Furnished Systems. IOC was rescheduled to Oct 90 due to the delivery slippage and the need for a longer Post Shakedown Availability (PSA). Subsequently, IOC was changed from Oct 90 to Nov 90 as a result of concurrent unplanned Carrier availabilities which delayed the start of PSA.

b. (U) Previous Change Explanations --

RD&E

Economic: Revised economic escalation rates.  
Schedule: Increase based on rephasing of R&D to accommodate rescheduling of FY92 ship to FY91.  
Estimating: Decrease based on returned cost for LHD 2, 3, and 4. Increases based on repricing of program requirements for LHD 4, 5, and 6; and increase to complete contract design on LHD 5.

Procurement

Economic: Revised economic escalation rates.  
Quantity: Increase based on addition of LHD 4 - 7, including associated advance procurement; and

\*\*\* UNCLASSIFIED \*\*\*

LHD - 1, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

re-categorization from prior SARs for outfitting and post delivery reported in Support.

Schedule: Decrease based on rescheduling of LHD 5 and LHD 6 and associated Advance Procurement. Increase based on mis-categorization of acquisition strategy change from Schedule to Estimating and rescheduling LHD 7 from FY00 to FY01.

Engineering: Decrease based on deletion of expanded Collective Protection System for LHD 5. Increase based on configuration for combat and ship system improvement, new requirements for women at sea, solid waste system and C3 communication upgrade for LHD 6.

Estimating: Reductions based on very favorable competitive basic award (LHD 2, 3 and 4); actual cost for completed program; reduction for GFE repricing; mis-categorization of acquisition strategy change from schedule and undistributed congressional funds for FY94 FFR&D Centers. Increases based on revised program estimates; deferred work on LHD 2 and 3; addition of LHD 6 and 7; lump sum benefit request for equitable adjustment; reduced vendor/business base, refurbished systems, CFE to GFE savings, revised outfitting and post delivery costs and re-categorization from prior SARs for outfitting and post delivery reported in support category.

Support: Adjustments based on prior year inflation.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

LHD - 1, December 31, 1995

15. (U) Contract Information (Cont'd):

contractor is identified with material and construction related savings partially offset by G&A growth.

Schedule Variance - The majority of favorable variance reported by the contractor results from material and engineering labor related recoveries.

The Navy approved a reprogramming in May 93 in the amount of \$127.7M. When the reprogramming without management reserve (\$2.9M) is taken into consideration, the negative cost variance to the target cost is \$76.5M.

The PM's Estimated Price at Completion takes these variances into consideration.

The Program Manager's Estimated Price at Completion is based on the Government's share of a projected total overrun of \$135.6M, which would result in a net contractor profit of \$20.9M.

The Current Contract Price includes an additional \$24.3M of Firm Fixed Price Construction Contract Line Items (CLINS), while the Initial Contract Price reflects only the Construction CLIN.

17. (U) Production Rate Data:

a. (U) Deliveries to Date --

|             | <u>Plan/Actual</u> |
|-------------|--------------------|
| RD&E        | 0/0                |
| Procurement | 4/4                |

b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

O&S costs for LHD 1 Class ships were developed from historical (VAMOSC) data for the antecedent LHA 1 Class as well as limited data that has come from the operations of LHD 1. Greater emphasis is still being placed on LHA 1 data for two reasons: the limited size of the LHD 1 data, and a belief that the first few years of operations of a lead ship are not representative of the ship's future, "normal" operating costs.

Personnel retirement costs are included as part of indirect costs and are based on 33 percent of officer and enlisted direct personnel costs.

Assumed service life is stated as 40 years for ships of the LHD 1 Class. All costs are in FY82 constant dollars, the year of the first construction contract for an LHD 1 Class ship.

b. (U) Costs -- (FY 1982 Constant (Base-Year) Dollars in Millions)

| Cost Element       | Avg Annual Cost Per<br>LHD 1 | Avg Annual Cost Per<br>LHA 1<br>(Antecedent) |
|--------------------|------------------------------|--|
| Direct Personnel   | 17.6                         | 14.9   |
| Direct Operations  | 9.6                          | 10.2   |
| Direct Maintenance | 18.1                         | 16.5   |
| Indirect Costs     | 6.4                          | 5.5  |
| Total              | 51.7                         | 47.1   |

c. (U) Contractor Support Costs -- None.

4. (U) Program Elements/Procurement Line Items (Cont'd):

PROCUREMENT:

APFN 2031 ICN AZ3507 (Army)

APFN 2031 ICN AA0976 (Army) (Shared)

5. (U) Related Programs:

AN/AAR-47 Missile Approach Detector, AN/AAR-54 Passive Missile Approach Warning System (MAWS), M-130 General Purpose Dispenser, AN/ALQ-144A(V)1/3 Countermeasures Set, AN/ALQ-156(V)1/2/3 Missile Approach Detector, M-206 Flare Decoys, Advanced Infrared Countermeasure Munitions (AIRCMM), Advanced Threat Radar Jammer (ATRJ), Directional Infrared Countermeasures (DIRCM).

6. (U) Mission and Description:

The ATIRCM/CMWS is a U.S. Army program to develop, test, and integrate defensive infrared (IR) countermeasures capabilities into existing, current generation host platforms for more effective protection against a greater number of IR guided missile threats than afforded by currently fielded IR countermeasures. The CMWS component system is a joint U.S. Army, U.S. Navy, U.S. Marine Corps, and U.S. Air Force program to develop, test, and integrate common missile warning system on tactical aircraft and rotorcraft for protection against IR guided missile threat (warning). The ATIRCM/CMWS is the core system of the U.S. Army's modular Suite of Integrated Infrared Countermeasures (SIIRCMM).

For the Army, the current Infrared Countermeasure (IRCM) configuration for the fleet helicopter consists of the AN/ALQ-144A for the AH-64 and the UH/MH-60 and the AN/ALQ-156 missile detector and M-130 flare/chaff dispenser for the CH/MH-47 and the AN/ALQ-144A, AND/ALQ-156 and M-130 on the EH-60. The ATIRCM/CMWS will selectively replace the AN/ALQ-144A, AN/ALQ-156 or AN/AAR-47, and the M-130. For the Navy and the Air Force, no existing equivalent systems exist.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

Preliminary tests of the DEMVAL prototype version of the ATIRCM during 1994 indicated successful performance against a variety of missiles. During 1994, the Services considered merging the ACAT II U.S. Navy/U.S. Air Force MAWS program with the ACAT III U.S. Army ATIRCM program. Because the previous ACAT III ATIRCM program became an ACAT IC ATIRCM/CMWS program within six months of the Milestone II ASARC date, acceptable and approved streamlining has been applied.

In January 1995, the Undersecretary of Defense for Acquisition and Technology (USD(A&T)), approved: (1) the recommendation from the Service Acquisition Executives to jointly develop a CMWS as a

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

ATIRCM/CMWS, December 31, 1995

**7a. (U) Program Highlights (Cont'd):**

component system of the U.S. Army ATIRCM program, and (2) the proposed streamlined joint program acquisition strategy. The USD(A&T) designated the U.S. Army as the lead Service, and designated the U.S. Army Acquisition Executive as the Milestone Decision Authority, in consultation with the other Service Executives.

The Milestone II decision review occurred on June 23, 1995. The ASARC members agreed to conditionally grant approval for the ATIRCM/CMWS program to proceed into EMD with the constrained excursion option presented. The conditional approval required a coordinated approved SIIRCM/CMWS ORD, an integrated product team (IPT) coordinated TEMP, and finalization and presentation of the multi-service memorandum of understanding (MOU) to the Service Acquisition Executives. In addition, the ASARC decision required a briefing on the results of Initial Operational Test and Evaluation (IOT&E), and a Production Readiness Review (PRR) is required before Milestone III.

The ORD was approved in September 1995, and the TEMP was IPT coordinated in December 1995. The MS II EMD contract was awarded to Sanders, a Lockheed-Martin company on September 27, 1995. The System Design Review (SDR) was held February 23, 1996 and all actions closed out by the end of March 1996. The contractor is on schedule for Preliminary Design Review (PDR) to be completed by June 1996. No problems relative to any cost performance or schedule parameter have been noted to date.

This is the initial SAR for the ATIRCM/CMWS program.

The ATIRCM/CMWS program is expected to satisfy the mission requirements.

b. (U) Significant Developments Since Last Report --  
None - Initial SAR

c. (U) Changes Since As Of Date --  
The Army Acquisition Executive approved the Acquisition Program Baseline on March 29, 1996.

**8. (U) Threshold Breaches:**

There are no breaches to the approved Acquisition Program Baseline (APB) dated March 29, 1996 and there are no Nunn-McCurdy unit cost breaches.

|---|----------------------|--------------------------|
|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
| Previous Cumulative Variances           | N/A                  | N/A                      |
| Cumulative Variances To Date (01/26/96) | \$0.1                | \$-0.7                   |
| Net Change                              | \$0.1                | \$-0.7                   |

Explanation of Change:

The unfavorable schedule variance is due to the delay in selecting the processor. The delay has postponed processor dependent work. Also, market availability of required skills has affected the schedule.

The favorable cost variance is not considered significant.

17. (U) Production Rate Data:

- a. (U) Deliveries to Date -- 0/0.
- b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

- a. (U) Assumptions and Ground Rules --

Average of twenty year operational life of 3069 baseline quantity. Baseline quantity assumes system composite configuration for the sum of the airframes. Includes all O&M funded human resource requirements not identified in development or procurement. Total ATIRCM system Mean Time Between Failure (MTBF) of 1000 hours. No airframe (group-A) operations and support costs are associated with the system (group-B).

Source of estimate is the methodology approved by the Army Cost Board June 1995.

- b. (U) Costs -- (FY 1996 Constant (Base-Year) Dollars in Thousands)

| Cost Element         | Avg Annual Cost Per Aircraft Composite System |     |
|----------------------|---|-----|
| Operations & Support | 5.9   | N/A |
| Total                | 5.9   | N/A |

- c. (U) Contractor Support Costs -- None.

**6. Mission and Description:**

SINGGARS is a family of VHF-FM combat net radios which provides the primary means of command and control for Infantry, Armor and Artillery Units. The SINGGARS system is designed on a modular basis to achieve maximum commonality among the various ground and airborne system configurations. A common receiver-transmitter (RT) is used in the manpack and all vehicular configurations. The SINGGARS family of radios has the capability to transmit and receive voice, tactical data and record traffic messages and is consistent with NATO interoperability requirements. The system operates on any of the 2320 channels between 30-88 Megahertz and is designed to survive in a nuclear environment. Communication Security (COMSEC) for the basic (non-ICOM) radio is provided by use of the VINSON device. An Integrated COMSEC (ICOM) version of the SINGGARS is the currently produced version. The SINGGARS system is operable in a hostile environment through use of electronic counter-counter measures (ECCM). SINGGARS is replacing the currently standard manpack and

6. Mission and Description (Cont'd):

vehicular radios, the AN/PRC-77 and the AN/VRC-12 family, respectively. An airborne version of the SINGGARS radio is replacing the currently standard aircraft radios, the AN/ARC-114 and AN/ARC-131.

7. Program Highlights:

a. Significant Historical Developments --

DA approved the SINGGARS ROC in Dec 74. In Jun 77, the VCSA direction resulted in a decision to proceed from Advanced Development (AD) directly into production. The SINGGARS ground radio production hardware was type classified standard at ASARC III in Sep 83. A single year production contract was awarded in Dec 83, Option 1 in Nov 84, Option 2 in May 85, Option 3 in Jun 89, and Option 4 in Dec 90 to ITT Aerospace/Communication Division (A/CD), Ft. Wayne, IN. The initial SINGGARS airborne production contract was awarded to ITT in May 85, Option 1 in Apr 88, Option 2 Apr 89, and Option 3 in Jan 91. The alternative source strategy was approved and documented in a Feb 87 Secretary of Defense Decision Memorandum (SDDM) to independently select and manage a second source which would be a form, fit, function equivalent to the ITT A/CD Integrated COMSEC (ICOM) SINGGARS at the Line Replaceable Unit (LRU) level. Award of the second source ground production contract was made to General Dynamics (GD) in Jul 88 with Option 1 awarded in Mar 91, Option 2 in Nov 92, and Option 3 in Aug 93. A Milestone IIIB review in Dec 90 approved full-rate production awards for the ITT ground and airborne radios in Dec 90 and Jan 91 respectively. A sole-source single year contract was awarded to ITT in Mar 92 with Option 1 awarded in Mar 93 to align with GD for head-to-head competition commencing in FY94.

An Aug 93 program review resulted in Defense Acquisition Executive (DAE) approval for award of General Dynamics Option 3 at full-rate production. The SINGGARS program was reclassified from Acquisition Category 1D (DAB) to 1C (Component). Head-to-head competition between ITT and GD commenced in FY94 with ITT receiving a 60% share and GD receiving a 40% share of total quantities.

b. Significant Developments Since Last Report --

The FY95 head-to-head competition between ITT and GD resulted in ITT receiving a 55% share and GD receiving a 45% share of total quantities. System Improvements continue as part of the planned evolution of the SINGGARS radio. Improvements include Global Position System Interface, Improved data capability for the Combat Net Radio, Improved Forward Error Correction for low speed data modes, Automated Interface in the Automated Common User System, Internet Controller (INC) software development, and improved MANPRINT to include the Hand-held Remote Control Unit. The Army Acquisition Objective of 213,000 radios was revised to 227,619 taking into account ongoing and projected force structure changes

SINGARS, December 31, 1995

7b. Program Highlights (Cont'd):

and reflects Active Army, Army Reserves, and Army National Guard units. The Congress was made aware of the significant savings to be achieved through accelerated procurement of SINGARS radios and provided an increase of \$54.1M to buy additional radios in FY96. The Army added funds in FY97 and FY98 to procure additional quantities to allow fielding three years earlier than planned.

The SINGARS system is expected to satisfy mission requirements.

c. Changes Since As Of Date -- None.

8. Threshold Breaches:

There are no DAE Approved Acquisition Program Baseline (dated August 18, 1993) breaches. There are no Nunn-McCurdy unit cost breaches.

9. Schedule:

b. Previous Change Explanations --

Late start of ITT First Article Test (FAT) plus problems encountered during the first phase of testing resulted in revisions to FAT completion, First Production Deliveries, Third Option award and Initial Operational Capability (IOC) in accordance with the schedule presented at the Dec 86 Joint Requirements and Management Board (JRMB) review. A contract rebaselining modification signed in Nov 87 revised hardware delivery schedules and resulted in the IOC being rescheduled from Dec 89 to Dec 90. A Jun 89 DAE Acquisition Decision Memorandum (ADM) capped deliveries of ICOM RT's at 730 per month until completion of additional operational testing and resulted in the rescheduling of the ITT ICOM Initial Operational Test & Evaluation (IOT&E). A required Follow-on Experiment (FOEX) on the ITT radio completed in Oct 90 required additional time for reporting and certification causing the rescheduling of the Milestone IIIB (ITT) Full-rate (ICOM) from Sep 90 to Dec 90. ITT Airborne Option 3 award was delayed from Nov 90 to Jan 91 due to the requirement for extended negotiations as the result of the government's decision to reduce the scope of work. Development of a new COMSEC chip for the GD radio and delays in the completion of contractor testing in preparation for First Article Test resulted in the rescheduling of all subsequent GD schedule milestones. Reliability problems and delay in delivery of test hardware resulted in a program decision to postpone start of GD's IOT&E (formerly POTE) from May 91 to Jan 92. GD FAT Complete schedule was revised from Mar 92 to Jun 92 to permit additional Production Reliability Acceptance Testing (PRAT). Resulting from the requirement to conduct a Confidence Verification Experiment on the GD radio, the ICOM IOT&E schedule was revised from Jan 92 to Feb 93. GD full-rate production program review and the option 3 award were delayed from Jun 93 to Aug 93 resulting from the lengthy review and approval process for the revised SINCGARS acquisition strategy. ITT Competitive (Basic) Award and GD Competitive (Basic) Award were delayed from Mar 94 to Apr 94 to permit briefings to DA and OSD advising of the results of best value determinations and the resulting percentages of the total buy awarded to each contractor.

PERFORMANCE CHARACTERISTICS AS DISPLAYED ARE SUBJECT TO THE FOLLOWING CONDITIONS:

- a. Data for specified performance characteristics demonstrated performance on production models is available from First Article Test and Follow-on Evaluations including operational testing.
- b. Performance characteristic parameters are point values not ranges.
- c. Measurement conditions for Communications Range: rolling plains, antenna not buried in foliage, average soil conditions, 10% bit error rate (ber).
- d. Since Manpack and Vehicular have the same value for MTBF, they have been combined and designated as Ground.
- e. The SINCGARS reliability requirement as approved in 1974 has no MTBF requirement or DCP threshold. This means that only radio hardware failures are counted, but under field test rather than in a lab. Demonstrated performance results are expressed on a point estimate basis on the AN/VRC-90 or 1477A airborne R/T system basis.
- f. Direct support Mean Time to Repair (MTTR) is not a cumulative requirement and does not include Organizational Level MTTR.

b. Previous Change Explanations -- None.

c. Current Change Explanations -- None.

b. Previous Change Explanations --

RD&E

Economic: Revised escalation indices.

Quantity: Addition of 45 prototypes for Integrated COMSEC (ICOM).

Schedule: Rescheduled effort due to funding constraints.

Engineering: Redesign radio and COMSEC device for Integrated COMSEC. Increased scope of work for P3I effort.

Estimating: Revised estimate for ICOM effort and Installation Kit (IK), SINCGARS Remote Control Unit (SRCU), and Second Source Test Program Set (TPS) development. Revised estimate for P3I cost studies. Removal of out year funding designated for SINCGARS follow-on system. Adjustments of prior year amounts to

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

SINGARS, December 31, 1995

13b. Cost Variance Analysis (Cont'd):

actuals. Current and prior year inflation offset.

Procurement

Economic: Revised escalation indices.

Quantity: Quantity adjustment due to Force Structure change.  
Adjustment due to including/changing other service requirements.

Schedule: Schedule slip resulting from problems during First Article Testing. Cost reduction caused by shortened schedule due to increased annual buys. ICOM deliveries capped until operational testing completed; costs to revise and extend contract delivery schedule for balance of program. Change in annual procurement buy profile.

Estimating: Revised estimates for warranty, COMSEC module, installation kits, Battlefield Electronic Communications Systems (BECS), KGV-10, SINGARS Remote Control Unit (SRCU), and Airborne ICOM production. Revised estimate for ground radios based on other service quantity buys and impact on learning curve calculations. Reduced hardware costs realized by applying learning curve through end of production versus only a specified quantity. Revised estimate for ground radio based on changes in procurement mix of ITT and GD radios. Additional installation kits for POMCUS. Revised estimate based on economies expected from first and second source competition. Current and prior year inflation offset.

Support: Revised requirement for radio spares, reclassification of initial spares from procurement to Army Stock Fund, elimination of spares requirement for KGV-10 and reduced estimate for data. Increased estimate for ground radio initial spares based on revised methodology (cost per operating hour). Addition of costs for Total Package Fielding (TPF) and New Equipment Training (NET). Addition of costs for Project Management Office salaries, Contractor Field Service Representatives, and Information Management.

SINGGARS, December 31, 1995

18. Operating and Support Costs:

a. Assumptions and Ground Rules --

SINGGARS is the VHF-FM radio communication system which provides the primary means of command and control for infantry, artillery and armor units. Since SINGGARS will be fielded to every type of unit in the Army, there is no "typical" division set; however, 4,500 receiver-transmitters (RTs) are used as an average division quantity. Ninety-eight per cent of the total buy will be fielded; costs shown are based on fielded divisions. SINGGARS does not require a dedicated operator except for an average of 1200 retransmission operators needed for specific missions. Operating tempo (peacetime) varies depending on the theater in which the radio is deployed and ranges from 177 hours per year for Reserve Units to 1638 hours per year in Europe. No depot overhaul is scheduled. Operating and Maintenance (O&M) (consumable) repair parts includes batteries. Maintenance includes depot maintenance, civilian field maintenance labor, and interim contractor support. Other Operating and Support (O&S) costs include training, transportation, System/Project Management and other sustaining support costs. The operating life of SINGGARS is 20 years. No operating and support cost data are currently available for the antecedent system, AN/PRC-77 and AN/VRC-12 family of radios.

SINGGARS Program Life Cycle Cost Estimate validated April 5, 1993.

b. Costs -- (FY 1984 Constant (Base-Year) Dollars in Millions)

| Cost Element             | Avg Annual Cost Per Division (4500 RTs) | Avg Annual Cost Per (Antecedent) |
|--------------------------|---|----------------------------------|

**5. (U) Related Programs:**

CG 47 AEGIS Cruiser, and DDG 51 AEGIS Destroyer Ship Classes, and TERRIER CG/NTU, TARTAR CGN/NTU, and Vertical Launch System.

(b)(1)

(U) Block II SM-2 is a variation of Block I SM-2. Block II Medium Range (MR) and Extended Range (ER) Missiles incorporate increased kinematics, new conventional warhead, improved fuzing, and improved guidance to provide enhanced capability against high flying, steep diving anti-ship missiles (ASMs). Due to the addition of a MK-104 Dual Thrust Rocket Motor, Block II MR missile range is double that of Block I MR missiles and approximates range of Block II ER missiles. The SM-2 Block II MR is deployed on TARTAR New Threat Upgrade ships and AEGIS CG-47/51 Cruisers and AEGIS DDG-51 Destroyers. The SM-2 Block II ER is deployed on all 31 TERRIER Guided Missile Cruisers and Destroyers.

(b)(1)

~~\*\*\* CONFIDENTIAL \*\*\*~~

STANDARD MISSILE-2, December 31, 1995

(b)(1)

7. (U) Program Highlights:

a. (U) Significant Historical Developments --  
The STANDARD Missile-2 Block I (RIM-67), Extended Range Development program was initiated in August 1976. The Block II is an improved missile with capability to counter high speed, higher altitude anti-ship missiles in an advanced ECM environment. Based upon TECHEVAL and OPEVAL results the CNO recommended approval of limited production in May 1983. The Block II improvements are required to meet the Advanced Anti-Ship Missile (ASM) threats of the mid 1980s.

(U) The STANDARD Missile-2, Medium Range, Block II (RIM/66H) is a derivative of the STANDARD Missile-2, Block II Extended Range that incorporated a new rocket motor and a modified airframe for compatibility with the vertical launcher system. Initial pilot production of 30 medium range rounds was approved for FY 83 in order to provide missiles for CSSQT and FOT&E testing in the CG 47 AEGIS Cruisers, the first medium range Block II ship. The Block II improvements are required to meet the Advanced Anti-Ship Missile (ASM) threats of the mid 1980s.

(U) The Milestone IIIC ARB was conducted 20 February 1985. On 8 June 1985, SECNAV approved limited production (Lot #3) for a FY 85 buy of 255 ER missiles and 529 MR missiles.

(U) The Milestone IIID Decision Memorandum was signed on 15 May 1986. SECNAV approved limited production for a FY 86 buy of 470 ER missiles and 846 MR missiles.

(U) The Milestone IIIE ARB was conducted October 1986 and the Navy Program Decision Meeting was held on 26 November 1986. As a result, the Approval for Full Production Decision Memorandum was signed 17 December 1986. Follower producer source selection of the GC&A was awarded to Raytheon Company on 6 June 1986. Second sources were selected for all STANDARD Missile components and all contracts were competitively bid in FY 88 except the MK 30 Sustainer which will remain single source due to small procurement quantities. Second sources selected for qualification were Raytheon (Guidance, Control, and Airframe); ATI (MK 115 Warhead Case); Bendix (Target Detecting Device); ARC (MK 104 Dual Thrust Rocket Motor); and Hercules (MK 70 Booster).

\*\*\* UNCLASSIFIED \*\*\*

STANDARD MISSILE-2, December 31, 1995

7a. (U) Program Highlights (Cont'd):

(U) The SM-2 MR and ER variants are no longer in production.

(U) Approval for production of the Block III was received 12 May 1988 by the Navy Acquisition Review Board.

(U) The Missile Homing Improvement Program (MHIP) was approved for Rapid Development Capability in January 1989.

(U) The Block III achieved IOC in August 1990. The Block IIIA completed OPEVAL in August 1991 with eleven out of twelve successful firings. The Block IIIA Production Readiness Review (PRR) process was completed in May 1991. The assembly of ordnance sections and integration into FTRs to support DT/OPEVAL Testing of the Block IIIA was initiated. The Block IIIB completed Technical Risk Assessment. A NPDM was held on 6 June 1991. This resulted in a restructure of the program and approved a new program baseline. In October/November 1990 five successful static firings of the Block IV Booster were completed. The Block IV restrained firing in a MK41 VLS was completed.

(U) General Dynamics Air Defense Systems, Pomona, CA was acquired by Hughes Missile Systems Company (HMSC) and is in the process of moving to Tucson, AZ. The Block IIIA production contract was awarded in January 1992. A Block IIIA Pre-production missile was flown successfully in January 1993 against an AEGIS Special Evaluation Test Target.

(U) A new Acquisition Program Baseline (APB) was approved for the SM-2 Block I/II/III/A/B on 10 December 1993, and for the SM-2 Block IV on 22 February 1994. HMSC's move to Tucson was completed, and the first AUR was delivered from the facility in August 1993. The Navy received funding from the Ballistic Missile Defense Organization (BMDO) to investigate the feasibility of the SM-2 in the TBMD role. The SM-2 Block IIIA achieved IOC in January, 1994 with the missile loadout of USS Vicksburg (CG 69).

(U) The new SM-2 Block IIIB TEMP was approved by OUSD(A&T) on 26 April 1994. A new APB for the SM-2 Block I/II/III/A/B was approved on 28 June 1994. On 21 October 1994, the first fully successful test flight of the SM-2 Block IIIB occurred. In July, 1994 the first at-sea firings of SM-2 Block IV were conducted, with 4 of the 5 flights successful. The unsuccessful mission was repeated on October 5, 1994 and was an unqualified success. The new TEMP for the SM-2 Block IV was approved by OUSD(A&T) on 2 August 1994. The SM-2 Block IV GTV series was completed in November, 1994 with 7 of 8 flights successful. DT/IOT&E was completed for SM-2 Block IV onboard USS Lake Erie (CG 70) with 4 of 6 flights successful on 6

\*\*\* UNCLASSIFIED \*\*\*

STANDARD MISSILE-2, December 31, 1995

7a. (U) Program Highlights (Cont'd):

October 1994. COMOPTEVFOR has concluded based on the DT/IOT&E findings that the SM-2 Block IV is potentially operationally effective and potentially operationally suitable and recommended proceeding to Low Rate Initial Production (LRIP). The SM-2 Block IV ARB was held on 9 January 1995 and the program was certified to proceed to the NPDM.

The SM-2 Block IIIB completed its initial phase of flight testing at WSMR, with the successful intercept of a Vandal target simulating prime threat on 15 June 1995. A new APB for the SM-2 Block IV was approved on 4 May 1995. The SM-2 Block IV received DAB approval for LRIP on 1 May 1995.

b. (U) Significant Developments Since Last Report --  
The SM-2 Block IIIB received approval to proceed to LRIP on 16 October 1995. A new APB for the SM-2 Block I/II/III/A/B was approved on 31 October 1995. The ADM was signed on 20 November 1995. The at-sea DT for the SM-2 Block IIIB was successfully completed on 8 December. This system will satisfy mission requirements.

c. (U) Changes Since As Of Date -- None.

8. (U) Threshold Breaches:

There is a cost breach to the SM-2 Block I/II/III/A/B APB dated 31 October 1995. There is a Nunn-McCurdy Unit Cost Breach, a cost breach and a schedule breach to the SM-2 Block IV APB dated 4 May 1994.

9. (U) Schedule:

SM-2 BLK I\II\III\A\B

b. (U) Previous Change Explanations --

SM-2 BLOCK II MR/ER

FOT&E for SM-2 MR on the USS Vincennes (CG 49) slipped from November 85 to May 86 due to ship availability. Lot 3 ALP slipped from April to May 86 due to ASN Scheduling. ARB was rescheduled to October 86 and NPDM was completed in December 86 causing Milestone IIIE (AFP) to slip from December 84 to December 86.

(b)(1)

Note: At the LRIP Program Decision quantities of 106 were approved with provision for more LRIP quantities should the program not transition to the SM-2 Block IVA as planned. Due to delays in the Navy Area TBMD program, an additional 54 units and 2 years have been added.

b. (U) Previous Change Explanations --

IOC for the SM-2 Block IV slipped 24 months due to program restructuring caused by technical problems. Test delays caused by further hardware technical problems caused a slip in IOC of 13 months. Schedule for Development Test, OPEVAL, MSIII, First Production Delivery and IOC slipped due to flight test delays arising from hardware technical problems. DT, OT, MS III, First Production Delivery, and IOC again slipped due to a delay in the flight test schedules caused by further hardware technical issues. Milestone IIIA and Milestone IIIB were replaced by LRIP Program Decision and Milestone III (Full Production). Delays in the approval of the STANDARD Missile Acquisition Strategy caused First Production Delivery and IOC to slip 3 months.

f. (U) Initial SAR (DEC 92)

|  |        |
|--|--------|
| (1) Program Acquisition Cost (BY\$) -- | 2567.5 |
| (2) Program Acquisition Cost (TY\$) -- | 4305.1 |

g. (U) Unit Cost Changes.

(1) (U) PAUC --

N/A

(2) (U) APUC --

This breach occurred due to Program Budget Decision (PBD) 123 which deleted all funding for SM-2 Block IIIA's all-up rounds (AUR) in FY96. The total SM-2 Buy for FY96 was therefore reduced to 17 SM-2 Block IV missiles over which all support dollars are spread in determining unit cost.

h. (U) Impact of Performance or Schedule Changes on Unit Cost.

The two year extension to SM-2 Block IV and resultant increased quantity had a decreasing effect to PAUC and reduced the extent of the breach to APUC.

12. (U) Unit Cost Summary (Cont'd):

SM-2 BLK IV

i. (U) Program Management and Control.

Because the AUPC breach occurred as a result of budget action and the resulting low annual buy in FY96, no Program Management or contract issues pertain. POC is CAPT R. L. Wilson, USN, PMS 422, (703) 602-0650 or CDR R. O. Scherini, USN, PMS 422F, (703) 602-1970.

j. (U) Cost Control Actions.

The Program Office will provide continued management attention.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised Escalation Indices. Economic Adjustment for Negative Program Change.

Engineering: Increase due to decision to pursue development of SM-2 Block IIIB and SM-2 Block IV.

Estimating: Extension of the Block IIIA and Block IV programs, adjustment for current and prior inflation, reprogramming due to new requirements.

Procurement

Economic: Revised escalation indices.

Quantity: Addition of a program year as a continuing program.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

STANDARD MISSILE-2, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

SM-2 BLK I\II\III\A\B

Decrease of 110 BLK IIIA missiles. Decrease of a further 18 BLK IIIA missiles.

Schedule: Budget changes. Increase due to program stretch-out and reduction in annual buy quantities. Shifting of missiles to outyears to procure more advanced variants.

Engineering: Introduction of early phases of low altitude improvements and improvements to the TDD, Warhead and Rocket Motor.

Estimating: Budget changes. Reduced costs due to competition for all major components in FY 88 and outyears. Increase due to changes in missile mix. Decrease due to inflation assumptions in POM 94. Increases due to continued program stretch-out. Increases due to reduction of annual buy quantities in FYDP. Increase due to changes in inflation assumptions. Correction to align Flyaway and Support.

Support: Budget changes. Adjustment to reconcile differences in previous support changes. Increase due to realignment of support due to program stretch-out.

MILCON

Economic: Revised Escalation Indices.

Estimating: Increase due to expanded facilities to meet requirements. Decrease due to revised requirements in FY 92 and 93.

Note: CARS Computational Model did not allow necessary Quantity allocation to Schedule category in 31 DEC 94 SAR. Previous Schedule variance is therefore overestimated and previous Quantity variance underestimated.

b. (U) Previous Change Explanations --

RD&E

Economic: Revised escalation indices.

Engineering: Addition of Block IV RD&E Program.

Estimating: Decrease due to revised requirements. Decrease due to change in requirements. Increase due to correction of controls.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

STANDARD MISSILE-2, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):  
SM-2 BLK IV

Procurement

Economic: Revised escalation indices. Economic Adjustment for Negative Program Change.

Quantity: Addition of 204 missiles to Block IV total buy. Decrease of 3098 units due to decision to transition to SM-2 BLK IVA production in FY97.

Schedule: Production deferred to FY 95. Increase due to program stretch-out and reduction in annual year buy quantities.

Estimating: Budget changes. Increase due to program stretch-out. Deletion of LLM. Decrease due to change in inflation assumptions. Decrease due to reduction in annual buy quantities and continued program stretch-out. Increase due to changes in inflation assumptions. Correction to align Flyaway and Support. Changes due to Acquisition Efficiency Adjustments, First Destination Adjustments, JLSC Decisions, and DBOF Rate Adjustments.

Support: Increase due to program stretch-out. Adjustments to align flyaway and support. Increase in initial spares. Increase due to realignment of support due to continued program stretch-out. Decrease due to decision to decrease buy of missiles to 106 from 3204.

T45TS, December 31, 1995

**6. Mission and Description:**

The T45TS is the Navy's strike pilot training system designed to replace both the T-2C and TA-4J and to produce 337 Strike and 36 E2/C2 Pilots each year through FY 2020 at two sites, NAS Kingsville and NAS Meridian. The system includes: 174 Production aircraft; 17 simulators; academic material, training aids, & equipment; a computer based Training Integration System (NAS Kingsville) to achieve total system efficiencies; and contractor logistics support of all system elements.

The T-45A is a derivative of the British Aerospace Hawk that has been adapted to provide the capability for carrier catapult take-offs and arrested landings. The simulator suite includes both Instrument Flight Trainers (IFT) and Operational Flight Trainers (OFT). Academics include textbook materials, classroom aids, and a computer-assisted instruction (CAI) system. The TIS utilizes existing hardware and software to provide scheduling and tracking of training events in order to achieve required training efficiency. Contractor logistics support has been structured to provide for future competition of maintenance support services to ensure that the system will be supported in the most cost effective manner. The system is currently up and operating at NAS Kingsville producing winged Naval Aviators.

**7. Program Highlights:**

**a. Significant Historical Developments --**

Full Scale Engineering Development of the T-45A Training System (T45TS) began in Sep 84. A twelve aircraft pilot production effort was approved in Nov 87. The first T-45A flight was in Apr 88 and in Nov 88 DT/OT-IIA determined the need to incorporate wing leading edge slats, engine upgrade, and speedbrake changes. Incorporation of these changes resulted in an McDonnell Douglas Aerospace Corporation (MDA) claim against the FSD and FY-88 contracts. In Dec 90, DT/OT-IIB determined changes restored T-45A potential operational suitability and effectiveness.

In Jan 90, McDonnell Douglas Corporation (MDC) began to move production from Douglas Aircraft Company (DAC) to MDC, St. Louis, Mo. The move was completed in late 90.

Low Rate Initial Production was approved in Jun 91 and the first production aircraft was delivered to Naval Air Station (NAS) Kingsville, Tx. in Dec 91. In May 92, the digital cockpit upgrade (Cockpit 21) development contract was awarded. A landing mishap in Jun 92 led to a revision of the Acquisition Program Baseline (APB) in Apr 93.

Operational Evaluation (OPEVAL) was completed 8 Apr 94. The T45TS was determined to be operationally effective and operationally

**7a. Program Highlights (Cont'd):**

suitable. Approval for fleet introduction was recommended. The first class of T45TS student jet pilots began on 4 Jan 94. The first T45TS trained aviators received their "Wings of Gold" on 5 Oct 94.

Milestone III and Full Rate Production approval for 174 total T-45A aircraft was received in Jan 95.

b. Significant Developments Since Last Report --  
F405-RR-401 engine durability remains high interest due to readiness impacts. Engine High Pressure Nozzle Guide vanes (HPNGV), Low Pressure Nozzle Guide Vanes (LPNGV), and Front Combustion Liner (FCL) assemblies are experiencing premature degradation and early removal. Fleet availability impacts have been minimized through development and use of borescope inspections prior to attaining 1000 hours.

A draft contractual agreement between the Navy/MDA and the Navy/Rolls-Royce has been prepared that outlines the engine Hot End Improvement (HEI) program. The contractor will: warrant 1,000 hour durability for the LPNGV, HPNGV, and FCL; fund the engineering program for redesign and test of HPNGV and FCL improvements similar to their responsibility for the LPNGV; and provide no cost ECP for LPNGV, HPNGV, and FCL. The Navy will: waive ASMET III for LPNGV redesign and grant engine qualification release (upon receipt and approval of outstanding compliance documentation); release withholds for LPNGV/HPNGV/FCL less government incurred expenses; and provide engine test asset for HPNGV and FCL.

Fleet trials of vapor-aluminized HPNGVs as a potential life improvement to HPNGV failures began in Sep 95 on three engines. Some improvement has been noted at the 500 hour inspection.

The digital cockpit upgrade (CP-21) commenced development testing 5 Mar 96. In Sep 95, contract modifications were awarded to MDA for the CP21 development, which extended the period of performance and allowed for the correction of design deficiencies identified during Mar 95 developmental testing. The operational assessment is scheduled for Apr 96. The ECP is now scheduled for Jun 96 approval for production incorporation commencing with aircraft A084.

As of Dec 31, 1995, the Training Command had flown over 57,200 T-45A flight hours. There were a total of 139 students in twenty-one classes in training.

The MDA claim is in deposition/documentation phase. Last MDA estimate of claim value was approximately \$450M (Oct 95). The Alternate Disputes Resolution (ADR) concluded Jan 96 without resolution. PEO(A) is considering arbitration to mediate a

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

T45TS, December 31, 1995

**7b. Program Highlights (Cont'd):**

resolution. Litigation procedures are on-going and a hearing before the Armed Service Board of Contract Appeals (ASBCA) is scheduled for 17 Jun 96.

A current unit cost reduction initiative being implemented by the airframe prime contractor, NDA, is consolidation of the AV-68 and T-45A contractor program management teams. A consolidation savings proposal was submitted by NDA with the FY95 production proposal and is currently being negotiated. The estimated cost reductions have been incorporated into the FY97 T45TS budget submission.

The T45TS is expected to satisfy mission requirements.

**c. Changes Since As Of Date --**

Cockpit 21 began DT IIIA on 5 Mar 96 at NAS Patuxent River, MD.

**8. Threshold Breaches:**

There are no breaches to the approved Acquisition Program Baseline dated January 19, 1995. There are no Munn McCurdy unit cost breaches.

**9. Schedule:**

The percentage of LRIP units has increased proportionately to the total quantity reduction (300 to 174). The original program planned 48 LRIP (FY89/90) units or 16% of 300 total. Due to delays in completing development which approved Full Rate Production in FY-95, OSD directed procurement of 60 LRIP units (FY89 thru FY94).

|-------------------------------|-----------------|
| Contractor                    | Program Manager |
| \$68.5                        | \$68.5          |

|   | Cost Variance | Schedule Variance |
|---|---------------|-------------------|
| Previous Cumulative Variances           | \$0.5         | \$-2.1            |
| Cumulative Variances To Date (01/31/96) | \$-2.3        | \$-0.2            |
| Net Change                              | \$-2.8        | \$1.9             |

Explanation of Changes:

The initial contract price reflected estimates prior to Letter Contract definitization.

Ceiling Price is not applicable.

The net change in the CPR cum variances is a result of the (Jan 96) CPR reporting against the original baseline (cost and schedule). The variance primarily results from the extended flight test program which identified deficiencies in the CP-21 design.

The contract was subsequently modified in Sept 95 to increase the negotiated cost and target price to \$68.5M, and extended the period of performance to correct the design deficiencies found during developmental testing. The CPR rebaseline (cost and schedule) resulting from the (Sept 95) contract modifications is planned to be reflected in Feb 96 CPR.

| \$52.9                 | N/A            | 0          | \$0.0                         | \$216.0                |

Explanation of Change:

Cost and Schedule variance reporting is not required on this FFP contract.

The Basic contract was awarded to Rolls Royce (Nov 93) and contains eight options, FY-94 through FY01.

The current funding total reflects definitization of the FY-94 and FY-95 options, and award of the FY-96 (option) Advance Acquisition Contract (AAC) Termination Liability (TL) funding.

The Program Managers EAC reflects the total estimate of contract which includes eight (8) option years at approximately \$27M annually.

T45TS, December 31, 1995

**18. Operating and Support Costs:**

**a. Assumptions and Ground Rules --**

The concept of operations of the T45TS is for total contractor logistic support (CLS), where the Navy provides the appropriate operational military personnel and flightline consumables, and the remainder is a turn key contractor operation. This program was specifically scoped to a 306 pilot training rate (PTR) per year, spread over two sites (NAS Meridian, and NAS Kingsville, TX). In order to meet this PTR, 101 aircraft are required to fly approximately 713.5 flight hours each per year. The steady state quantity of flight hours is 72059. These quantities reflect the incorporation of JPATS into the T45TS program, and were used in the calculation of Mission Personnel, Unit-Level Consumption, Contractor Logistics Support, Sustaining Support and Indirect Support. In section b costs, Mission Personnel costs include the costs for pay and allowances for enlisted personnel and officers. Contractor personnel involved in the maintenance of the T-45 are not included in the element, but within the CLS portion of the O&S.

Unit-Level Consumption costs include the cost for Petroleum, Oil & Lubricants (POL) required for peacetime operations, and Training Ordnance costs. The 36 PTR for E2/C2 aircraft have no ordnance requirements, and therefore are not included in the estimate. Consumables/Repair Part and Depot Level Repairables are not included in Unit-Level Consumption, but within CLS, as maintenance is performed by the contractor.

Contractor Logistics support costs include the costs for Aircraft Maintenance; Ground Training System (GTS Maintenance, Replenishment Spares, ROR, Simulator Maintenance, and Operations Costs); Training Spt Center Maintenance; Program & Administrative Mgt; Off Site Repair (Engine Depot ROR, Aircraft ROR, SE ROR, and Airframe Rework); Detachment Support; Travel & Per Diem; and other Direct Charges. Sustaining Support Costs include the costs for Modifications kits needed to achieve acceptable levels of safety, overcome mission capability deficiencies, and reliability, and reduce maintenance costs. Support Equipment Replacement is performed by the contractor, and is included in CLS under ROR. Sustaining Engineering Support, Software Maintenance, and Simulator Operations costs are also included in the cost for CLS.

Indirect costs include the costs for Student Aviators and Installation Support. Installation Support includes costs for personnel normally assigned to the host installation who are required for the unit to perform its mission in peacetime.

5. (U) Related Programs:

Army Tactical Command and Control Systems (ATCCS), which include: Maneuver Control System (MCS), Advanced Field Artillery Tactical Data System (AFATDS), Combat Service Support Control System (CSSCS), Forward Area Air Defense Command and Control System (FAADC2), and Common Hardware Software (CHS). Joint Prototyping/Technology Insertion Office (JP/TIO, which includes WARRIOR and Warlord), Tactical Simulation (TACSIM), Joint Collection Management Tools (JCMT, which includes Collection Management Support Tools (CMST)), Joint Deployable Intelligence Support System (JDISS), Standard Integrated Command Post Shelters (SICPS), Commander's Tactical Terminal - Hybrid Receive Only (CTT-HR), Integrated Meteorological System (IMETS), Digital Topographical Support System (DTSS), Battle Command Battle Laboratory (BCBL) Huachuca, and Single Source Processor-Signals Intelligence (SSP-S).

6. (U) Mission and Description:

As the Intelligence and Electronic Warfare (IEW) sub-system of the ATCCS, the All Source Analysis System (ASAS) provides all source intelligence fusion to gain a timely and comprehensive understanding of enemy deployments, capabilities, and potential courses of action. With this knowledge, battle managers will be able to view the battlefield and more effectively conduct the land battle. ASAS is a tactically deployable ADP system used to receive and correlate data from strategic and tactical intelligence sensors/sources; produce ground battle situation displays; rapidly disseminate intelligence information; provide target nominations; help manage organic IEW assets; and assist in providing operational security (OPSEC) support. The system is theater independent and designed to operate in peace-time, supporting contingency and crisis operations during low, mid, and high intensity wartime, and during restoration and return to peace stabilization periods. ASAS has been designated by Congress as the Army's only tactical intelligence fusion project.

ASAS is being produced and fielded in two hardware configurations and three software versions. The current configuration, Block I, was formerly planned for procurement and fielding to corps and active divisions in the years 1992 through 1997. This configuration was restructured in FY91 to include Hawkeye, an OSD-sponsored

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

ASAS, December 31, 1995

6. (U) Mission and Description (Cont'd):

balanced technology initiative. Because of the restructuring, Block I will now be fielded to the above units in the FY93-95 timeframe without having had to go into full rate production.

Block I is made up of the Communications Control Set AN/TYQ-40 which receives and transmits information from multiple sensor systems; the Data Processor Set AN/TYQ-36 which processes intelligence data; the Workstation, Computer Graphics AN/TYQ-37 which is the primary user interface with the system; and Workstation, Computer Graphics AN/TYQ-52(V) which processes intelligence data.

Block II is made up of objective hardware modules using ATCCS Common Hardware/Software (CHS) components. ASAS Block II hardware procurement will begin in FY99 and full fielding to the Army's force structure will begin in FY00. ASAS Block III is a software development effort which will bring ASAS to its full objective capabilities. It will be used with the hardware procured in Block II. There is no Block I antecedent system. ASAS Block II replaces ASAS Block I equipment with improved functionality and common hardware and software. The ASAS acquisition strategy maximizes the use of government and commercial Non-Developmental Item software, OSD directed Common Operating Environment software, incremental phased deliveries, and continuous user test and evaluation.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --  
ASAS was to be the Army portion of a joint program originally chartered at Congressional request to acquire an Army/Air Force fusion system to meet the critically needed requirements for an automated intelligence command and control system. As a result of Congressional review and Department of the Army guidance, all modules were downsized into smaller shelters more appropriate to the battlefield environment. During FY85 the program developed the ASAS Interface Module (AIM) Brassboard (ABB) which provided a near-real-time processing capability. The System Readiness and Verification Test for the ASAS AIM and the Forward Sensor Interface Control (FSIC) Module was successfully completed in October 1986. Subsequent to the test, this equipment was delivered to III Corps/2nd Armored Division. In 1986 the Assistant Secretary of the Army (Research, Development and Acquisition) approved a directed limited procurement urgent (LPU) for the Limited Capability Configuration (LCC). The procurement contract was let in March 1987 for production of LCC's. In November 1987, the Joint Oversight Group (JOG) approved an acquisition strategy of LCC's to be delivered to Ft Hood, TX in FY89. In February 1988, the JOG approved the expansion of the LCC acquisition to include systems to Europe. During 1989, ASAS conducted its Force Development Test and

\*\*\* UNCLASSIFIED \*\*\*

ASAS, December 31, 1995

7a. (U) Program Highlights (Cont'd):

Experimentation which supported the Operational Test and Evaluation Agency's continuous evaluation of ASAS. On 10 January 1990, the Chief of Staff of the Army directed the program restructure to field the system very quickly with minimum level of functionality acceptable to the user. In April 1990 the Air Force withdrew from the Joint Tactical Fusion Program Office (JTFPO). In May 1991 the JTFPO was disestablished by DA General Order 11. The Army placed ASAS under the Program Executive Office for Command and Control Systems. On 4 December 1991, the C3I Committee approved release of the RFP for the Block II contract for conversion to ATCCS hardware/software. The ASAS software was accredited by the Defense Intelligence Agency. On 19 December 1991, the ASAS Acquisition Program Baseline, Test and Evaluation Master Plan, Acquisition Strategy Report were approved by the Defense Acquisition Executive. On 17 January 1992, the Request for Proposal for the ASAS Block II Engineering and Manufacturing Development (E&MD) contract was released. ASAS Block I IOT&E was conducted 8 Sep-11 Oct 1992.

In 1993, three units received ASAS Block I equipment and training. Operational Effectiveness was successfully demonstrated at the Technical Test and Operational Demonstration in May-Apr 1993. ASAS received DIA accreditation for operational use world-wide in March 1993. First Unit Equipped (FUE) was the 82nd Airborne Division. In July 1993, the Army Systems Acquisition Review Council (ASARC) approved the ASAS to proceed to the Defense Acquisition Board (DAB) for a Milestone II decision for ASAS Block II. ASAS was granted Type Classification Limited Procurement for Block I. In October 1993, a "paper" DAB approved MSII for ASAS Block II and an Acquisition Decision Memorandum dated 21 October 1993 approved entering E&MD for Block II. ASAS Block II contract was awarded to Martin Marietta on 29 October 1993.

In 1994, the Vice Chief of Staff, Army (VCSA) approved the ASAS-Extended concept that would field an ASAS Capability to the remainder of the force by using proven ASAS software on commercial hardware. It is a non-developmental item (NDI) suite of commercial hardware running standard ASAS software. ASAS-Extended allows fielding an ASAS capability to the entire force earlier than planned and at a fraction of the cost of the ruggedized Block I system.

A successful Block I IOT&E II was conducted during Aug-Sep 94. The Operational Evaluation Command (OEC) found ASAS to be operationally effective and suitable for its intended use.

In June 1994, the Project Manager ASAS was designated PM Intelligence Fusion with responsibility for ASAS, Single Source Processor-SIGINT (SSP-S) and the Joint Prototyping Office (JPO). Joint Collection

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

ASAS, December 31, 1995

7a. (U) Program Highlights (Cont'd):

Management Tools (JCMT) was added in 1995 and the Integrated Meteorological System (IMETS) program in 1996.

b. (U) Significant Developments Since Last Report --  
ASAS has embarked on a new dimension of operational employment. As directed by USCINCEUR, USAREUR has deployed three Mini-Deployable Intelligence Support Element (Mini-DISE) teams to non-US IFOR units supporting Task Force Eagle (Nordic Brigade, Russian Brigade, Turkish Battalion). Each team has a laptop computer with either ASAS-Warlord or ASAS Warrior software.

On 31 October, 1995, a major Block II contract modification was executed. A rewrite of the program baseline and acquisition strategy has been initiated to reflect the restructured program and PEO guidance to implement the Common Operating Environment, the Modern Information Database (MIDB) and Task Force XXI initiatives and exercises. Draft revisions of the Acquisition Program Baseline, the Acquisition Strategy Report, and the Test and Evaluation Master Plan went to DA and OSD for staffing.

PM Intel Fusion accepted the Block II, Phase 1 delivery from Lockheed Martin Astronautics (LMA) on 4 April 1995.

In February, 1996, the Army, in an effort to streamline testing, directed that ASAS revise its test strategy to reflect the Secretary Perry directive to have a single test and evaluation program to collect and evaluate both operational and technical data and to make better use of data collection opportunities provided by training, unit exercises, etc. ASAS is one of four systems selected for initiating this approach and Operational Evaluation Command has the lead to prepare a single System Evaluation Plan (SEP) to be incorporated into the TEMP. The SEP is not expected to be available before May 1996. After receipt of the SEP inputs, the new TEMP will be submitted to the TIWG for approval within 30 days. After TIWG approval, the TEMP can then go through the full approval process (PEO C3S, HQ TRADOC, HQ OPTEC, and DA staff).

ASAS will be providing Brigade and Battalion warfighters automated tools to be more effective and will do this three years earlier than planned.

The Collateral Workstation (CWS) was transitioned to CECOM on 1 March 1995. Fielding of all 12 Block I systems was completed in March, 1995.

The ASAS system is expected to satisfy mission requirements.

- 5 -

\*\*\* UNCLASSIFIED \*\*\*

ASAS, December 31, 1995

7c. (U) Program Highlights (Cont'd):

c. (U) Changes Since As Of Date --

ASAS is being used extensively in Bosnia and the database capabilities give the warfighter a big advantage. The ASAS products are extremely reliable and are a real success story.

The RWS-VI software baseline was successfully transitioned to CECOM in February 1996. Also, the Single Source Capability Package (CP01) drop to the Government occurred in February 96.

By March 1996, every EAC, Corps and Division had an ASAS capability.

8. (U) Threshold Breaches:

Block II/III

There is currently a schedule breach to the approved Acquisition Program Baseline (APB) dated 21 Oct 93. Both a Program Deviation Report and a revised Acquisition Program Baseline (APB) have been submitted. There are currently no Nunn-McCurdy unit cost breaches.

9. (U) Schedule:

b. (U) Previous Change Explanations --

In 1992, reductions in funding available during the Block II development period forced the combat developer to reprioritize its requirements. This resulted in amendments to the RFP and postponing contract award from January 1993 to June 1993. The Block II prototype development effort provides for user reviews and tests of capability packages provided to Block I systems as part of the contract deliverables. Milestone III associated with the Block II development effort moved from November 97 to July 99 because of the delay in the Engineering and Manufacturing Development contract award.

Restructured ASAS Block I will be fielded to Force Package I using already procured modules and requiring only an ASARC/IPR approval for material release. ASAS Milestone III decision scheduled originally for Block I in February 1993 is now scheduled for November 1997 for Block II. Block II will be fully interoperable with ATCCS and will be built on common hardware and software CHS II and will use open architecture.

Block II RDT&E contract award changed from SEP93 to OCT93 to reflect actuals. Milestones added to the APB dated October 21, 1993. Contract award changed from NOV99 to N/A because it is no longer part of the approved program. Initial Operational Capability changed from AUG01 to DEC99 IAW accelerated fielding.

New APB being processed includes new milestones not originally in the SAR Development Estimate. Due to restructured streamlined program, milestones which are no longer applicable to the ASAS Block II are being deleted from the ASAS Block II APB, and will be deleted from future SARs.

10a. (U) Performance Characteristics (Cont'd):

CCS - Communications Control Set

G2-TOC - Assistant Chief of Staff, Intelligence (General Staff)  
Tactical Operations Center

Footnotes:

1/ Due to the evolutionary nature of ASAS, the noted performance parameters represent a desired military capability for the initial fielding and Block II development of ASAS. Performance parameters of enhancements and upgrades will meet full ORD requirements and Defense Information Systems Agency (DISA)/DODIIS Interoperability Standards, and will be provided during the evolutionary phase of the program.

2/ Block III will provide the remote workstation, enhance the previously developed software applications functionality, and provide new software applications in the disciplines of electronic warfare, operations security, human intelligence, imagery intelligence, and communication intelligence/electronic intelligence integration. Block III performance parameters will be provided prior to Block III Critical Design Review (CDR).

Recurring costs in years without quantities represent incremental procurement of workstation upgrades and Brigade/Battalion workstations, both of which are other than the unit of measure.

17. (U) Production Rate Data:

- a. (U) Deliveries to Date -- 0/0.
- b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

- a. (U) Assumptions and Ground Rules --

(Reference: Army Cost Position (ACP), July 1993) The concept of operation for ASAS is a mobile battlefield automated data processing system operating on a peacetime scenario utilizing an operating tempo of 2160 hours per year, with exception to Military Pay which is based on a wartime scenario with an operating tempo of 7555.5 hours per year. The system employs a three tier maintenance concept. At the Organizational level, system malfunctions will be analyzed

18a. (U) Operating and Support Costs (Cont'd):

down to the Line Replaceable Unit (LRU); at the intermediate (DS/GS) level, repair and replacement of unserviceable assemblies and subassemblies will be accomplished; and major overhaul and rebuilding will occur at the Depot.

The costs to operate and support the system include personnel costs of operators, maintainers, and support personnel. PCS costs are included. The sustaining materiel cost consists primarily of replenishment spares and repair parts, POL, and Modifications Kits.

Comanche (RAH-66), December 31, 1995

5. (U) Related Programs:

Air-to-Air Stinger Missile System; Hellfire Anti-tank Missile System and Longbow.

6. (U) Mission and Description:

This program provides for the development of the RAH-66 Comanche. The Army requires an aviation system capable of performing aerial reconnaissance on the modern battlefield. Combat lessons learned and mission analysis have repeatedly supported a critical combat requirement for an aviation reconnaissance system capable of 24 hour combat operations, responsive to the battlefield commander in night and adverse weather conditions and able to survive on the 21st century battlefield. This air cavalry helicopter system will be self-deployable with highly improved sustainability and availability to support continuous combat operations in any world trouble spot. Comanche will be able to find the enemy with a low probability of self-detection and either engage or hand-off the target based on the battle commander's decision. The air cavalry system will be able to operate effectively in the close, deep or rear battles. Comanche incorporates emerging technologies to provide a leap-ahead air cavalry system, field a world-wide deployable, air cavalry reconnaissance helicopter; operate with minimal logistical burden, serve as the command and control node for the commander to win the knowledge war. This system will provide three dimensional battlefield situational awareness with greater depth and breadth than currently possible. This picture of the battlefield will be overlaid on digital maps that consolidate all real time data. The system will display friend or foe discrimination and will avoid detection and survive by reducing signature and incorporating low observable technology. The Comanche helicopter will replace the current light fleet of tactically obsolescent AH-1, OH-6 and OH-58A/C helicopters. The Comanche system will be integrated with the Army aviation force structure to complement the AH-64 Apache helicopter.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

In March 1982, the Army Aviation Mission Area Analysis (AAMAA) was endorsed by senior Army leadership at the Army Aviation Systems Program Review. From that review, the Comanche emerged as the most viable concept to meet fleet needs. A Comanche Justification for Major Systems New Start (JMSNS) was submitted in June 1983. The Comanche was further developed and refined during FY 1984. In December 1985, a Defense Science Board (DSB) Task Force was established to review the Comanche program. The task force reported the Army had a need for a new light helicopter and that technology existed which could support the design of a weapon system of much greater performance than the existing fleet. As the result of the June 9, 1988, Comanche Milestone I Defense Acquisition Board (DAB)

7a. (U) Program Highlights (Cont'd):

review, an Acquisition Decision Memorandum (ADM) dated June 17, 1988, approved the Comanche program to proceed with Demonstration/Validation (Dem/Val). In 1988, the Light Helicopter Turbine Engine Company (LHTEC) was announced the winner of the competitive T800 engine program. The Comanche program was restructured in August 1990. The restructure deferred the Engineering and Manufacturing Development (EMD) and extended the Dem/Val phase by an additional two years. In 1991, the Boeing Sikorsky team was declared the winner of the competitive Comanche air vehicle program and was awarded a contract for the Dem/Val Prototype phase. The Comanche program was again restructured in January 1992, as a result of the Defense Acquisition Executive Guidance and the FY 1993 President's budget reductions. The restructured contract modifications were issued to Boeing Sikorsky and LHTEC in January 1993. In December 1994, the Comanche Program was restructured as a prototype industrial/technology base program with two flyable prototypes.

b. (U) Significant Developments Since Last Report --  
As the result of the Defense Acquisition Board review of the Comanche restructured program, an Acquisition Decision Memorandum was issued in March 1995 to continue the Demonstration/Validation phase with two flyable prototypes and add six aircraft within the FYDP for user evaluation.

The Comanche system is expected to satisfy the mission requirement.

c. (U) Changes Since As Of Date --  
First Flight of Aircraft #1 was achieved January 4, 1996.

8. (U) Threshold Breaches:

There are no breaches to the approved Acquisition Program Baseline (APB) dated January 30, 1996. Nunn-McCurdy unit cost reporting is not required for this pre-milestone II program in accordance with Section 2433, Title 10, USC.

b. (U) Previous Change Explanations --

Milestones revised from AMC approved Acquisition Strategy (December 16, 1985) to reflect 1995 IOC Acquisition strategy as approved by the Chief of Staff of the Army on November 10, 1986. Milestones were revised based upon DAE approved baseline dated June 15, 1988 (Milestone I ADM, dated June 17, 1988). Milestones changed as a result of a schedule assessment made in response to the direction contained in the SecDef letter, August 23, 1990. Program restructured per DAE, January 29, 1992, subject: Implementation of Acquisition Decision. Dates changed from TED to the current estimate dates shown in Approved Program Baseline dated January 4, 1993 due to initiation of the Comanche Restructured Dem/Val Prototype Program. Critical Design Review milestone revised to actual date. Dem/Val Prototype Flight Test Program Start milestone revised as a result of schedule assessment. Early Operational Assessment milestone deleted from current baseline because of duplication with Limited User Testing. Milestone dates changed in response to approval of the Army's Comanche Early Operational Capability program.

c. (U) Current Change Explanations --

(Ch-1) The current estimate of schedule milestone dates were revised based upon approved Acquisition Program Baseline dated January 30, 1996. These milestones are no longer being tracked. The following milestones changed.

Dem/Val Prototype Flight Test Program Start from Nov 95 to N/A.  
Dem/Val Prototype Flight Test Program Complete from Oct 01 to N/A.  
Award EMD Contract from Nov 01 to N/A.  
T800 Engine Production Contract Award from Nov 04 to N/A.  
IOT&E Training/ARTEP Start from Jan 05 to N/A.  
IOT&E Training/ARTEP Complete from Aug 05 to N/A.  
First Air Vehicle Production Delivery from Jul 06 to N/A.  
RAM Validation Start from Nov 95 to N/A.  
RAM Validation Complete from Jul 06 to N/A.  
Air Vehicle Production Contract Award (LRIP) from Nov 04 to N/A.

(Ch-2) Milestone revised from N/A to actual date of occurrence based

At the direction of the Joint Requirements Oversight Council (JROC), the Performance Characteristics of: Radar Cross Section; Night Hot Target and Digitally Exchange Battlefield Information to Joint & Combined Arms Forces are being reevaluated by the User. A revised APB will be submitted upon approval by the JROC.

Comanche (RAH-66), December 31, 1995

10b. (U) Performance Characteristics (Cont'd):

b. (U) Previous Change Explanations --

Utility/Attack design excluded from refocused program. MTBMAF and MTTR revised to reflect changes in Reliability, Availability and Maintainability (RAM) rationale report. MMH/FH revised from 2.8 to 2.6 hours to reflect results of RAM data analysis. PMCW weapon load increased from 4 to 6 missiles to reflect analysis of Comanche Milestone I Cost and Operational Effectiveness Analyses (COEA). Engine size changed from 1200 to 1233 due to initial testing of T800 engine. MTBEMA changed from 4.5 to 5.1 and MTBMAF from 8.5 to 9.5 to reflect program goals instead of thresholds. Dash Speed estimate adjusted from 180 knots to 170 knots to reflect Dem/Val phase design trade-offs. VROC changed from 500 to 860 to reflect the Armed Reconnaissance Mission Configuration Requirement which does not contain the Longbow Fire Control Radar.

c. (U) Current Change Explanations --

(Ch-1) Current estimate of performance characteristics have been revised based upon approved Acquisition Program Baseline dated January 30, 1996. These characteristics are no longer being tracked and may be deleted in future SARs. These characteristics have changed.

Empty Weight (lbs) from 7765 to N/A  
Primary Mission Gross Weight (PMGW - lbs) from 10595 to N/A.  
Dash Speed, Knots @ 4000 ft/95 deg F @ IRP from 175 to N/A.  
Turn to Target (sec) from 4.7 to N/A.  
Single Engine Operation, Knots @ CRP 100 FPM from 40 to N/A.  
Climb Rate (Vertical Impact Velocity - FPS) from 38 to N/A

(b)(1)

Operational Availability Peacetime (percent) from 87 to N/A.  
Payload RAH Hellfire Internal Missile Capacity from 6 to N/A.  
Payload RAH Hellfire External Missile Capacity from 8 to N/A.  
Gun Ammo Capacity (rounds) from 500 to N/A.  
Refuel/Rearm (no. of personnel-time (mins)) from 3-15 to N/A.  
Air Transportability Time to Load/Unload (min) C-5A from 20 to N/A.  
Air Transportability Time to Load/Unload (min) C-130 from 22 to N/A.  
Engine Size, Intermediate Rated Power at Sea Level Standard from 1400 to N/A.

10c. (U) Performance Characteristics (Cont'd):

Self Deployable (NM) w/ 30 min reserve from 1260 to N/A.

EMI/EMP Protection (Volt/M) from 200 to N/A.

(Ch-2) The Current Estimate of Performance Characteristics revised in accordance with approved Acquisition Program Baseline dated January 30, 1996. The following were changed.

Mean Time Between Essential Maintenance Actions (MTBEMA) (hrs) from 5.0 to 4.5.

Mean Time Between Mission Affecting Failure (MTBMAF) (hrs) from 9.8 to 8.5.

(Ch-3) The current estimate of these Performance Characteristics were added as a result of the approved Acquisition Program Baseline dated January 30, 1996. They are

(b)(1) [REDACTED]

Digitally Exchange Battlefield Information to Joint & Combined Arms Forces Yes.

Multifunctional Launch Station ATGM, ATAM, Rockets (Internal)/Turret Gun System 6/1.

15. (U) Contract Information (Cont'd):

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$-33.8              | \$-16.9                  |
| Cumulative Variances To Date (12/31/95) | <u>\$-35.9</u>       | <u>\$-14.2</u>           |
| Net Change                              | \$-2.1               | \$2.7                    |

Explanation of Change:

Schedule performance was driven by delivery of material required for the assembly of aircraft #1. This was partially offset by delays in materials for testing and to support first flight of aircraft #1.

Cost performance is due to design changes, analysis, tool design and fabrication, assembly and testing of the aircraft #1.

| (U) T800 Growth AVS:<br>LHTEC, St. Louis, MO<br>DAAJ09-92-C-0453, CPFF<br>Award: April 13, 1992<br>Definitized: January 5, 1993 | Initial Contract Price |                |            |

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$3.2                | \$-2.1                   |
| Cumulative Variances To Date (12/31/95) | <u>\$4.6</u>         | <u>\$-3.5</u>            |
| Net Change                              | \$1.4                | \$-1.4                   |

Explanation of Change:

Schedule performance improvement was driven by material characterization studies, material deliveries and component testing to get ready for Critical Design Review for the Growth Engine. The Air Vehicle Support portion of the contract, in support of the Comanche Air Vehicle, continues to be on schedule. The Cost performance improvement in both portions of the contract is the result of manpower efficiencies and overall positive labor rates.

6. (U) Mission and Description:

The SEAWOLF submarine will be a multi-mission vessel that will introduce unprecedented performance capabilities. It will be the quietest, most heavily-armed attack submarine the Navy has ever built. The design of the SEAWOLF is based on an extensive research and development program and will incorporate technological advancements to provide: order of magnitude improvement in ship quieting; improved acoustic sensors; more capable combat systems; greater weapon capacity and capability; quieter launch; weapon launch at high ship speed; advanced reactor; improved performance machinery program; an advanced propulsor; increased operating depth; improved ship control; and enhanced survivability.

The SEAWOLF will have eight large-diameter torpedo tubes, and will hold significantly more weapons than any other U.S. nuclear attack submarine. A stronger hull material will enable deeper dives. In addition, the vessel will be configured for operation in Arctic

SSN 21 CLASS/BSY-2, December 31, 1995

6. (U) Mission and Description (Cont'd):

areas.

The AN/BSY-2 Submarine Combat System supports the SSN 21 mission to conduct prompt and sustained combat operations. The AN/BSY-2 Submarine Combat System improves upon existing combat systems to meet the expanded operational requirements of attack submarines in countering the future threat. The AN/BSY-2 Submarine Combat System provides combat control and acoustic functions to support the ship characteristics of the SSN-21. The warfare tasks supporting this mission are: Strike Warfare, Anti-Submarine Warfare (ASW), Surveillance/Indication and Warning, Anti-Surface Warfare, Mine Warfare, Special Warfare; Ocean Surveillance, Intelligence/Reconnaissance, Command, Control, and Communication (C3), Electronic Warfare, support of battle group operations, and Naval Special Warfare.

7. (U) Program Highlights:

- a. (U) Significant Historical Developments —
- 81 - An original Submarine Combat System program (SUBACS) was initiated.
- Jun 82 - GROUP TANGO was established to assess the need for an advanced technology submarine.
- Dec 82 - CNO directed NAVSEA to proceed with feasibility studies.
- Jun 83 - SECNAV approved the SSN 21 conceptual design.
- Jun 84 - SECDEF Decision Memorandum authorized the Navy to proceed with the SSN 21 Class preliminary design phase.
- May 85 - Preliminary design phase completed.
- Early 1986 - AN/BSY-2 design definition began with the award of contracts to RCA and IBM.
- Oct 86 - Milestone I (AN/BSY-2) approval.
- Oct 86 - Detail design was authorized.
- Apr 87 - Newport News Shipbuilding (NNS) obtained the lead design yard contract.
- Mar 88 - Original Program Baseline Document was approved.
- Mar 88 - Milestone II (AN/BSY-2) approval.
- Mar 88 - The AN/BSY-2 awarded General Electric (GE) a Full Scale Development (FSD) contract.
- Dec 88 - The AN/BSY-2 Limited Production (LP) option for SSN 21 system exercised.
- Jan 89 - Electric Boat (EB) was awarded the SSN 21 construction contract.
- Oct 89 - SSN 21 construction commenced.
- Jan 91 - A combined SSN 21 and AN/BSY-2 program review was held with the DAB. LRIP approved in February 1991.
- May 91 - EB was awarded SSN 22 construction. NNS filed suit.
- Jul 91 - The U.S. District Court Eastern District, VA declared SSN 22 construction contract void.

SSN 21 CLASS/BSY-2, December 31, 1995

7a. (U) Program Highlights (Cont'd):

- Jan 92 - The SSN 21/AN/BSY-2 program was truncated after lead ship. The proposed rescission package zeroed all FY 93 and outyear funding.
- Jun 92 - Public Law 102-298 reinstated the SSN 22. Contractors' stop work orders and terminations Request for Equitable Adjustments (REA) began to be submitted.
- Jun 92 - SSN 22 ship construction stop work order was lifted.
- Jul 92 - The U.S. District Court dismissed the case.
- Sep 92 - SSN 22 construction commenced.
- Sep 92 - An AN/BSY-2 program replan was executed to adjust the GE FSD/LP contract due to SEAWOLF Program truncation.
- Nov 92 - EB submitted a REA for the SSN 22 stop work period.
- Sep 93 - Settled SSN 22 REA for \$42M with a 12 month delay.
- Nov 93 - Received direction to upgrade the second AN/BQG-5 to a full-up shipset, procure a third system, and develop Full Search Capability.
- Dec 93 - AN/BQG-5 hardware delivered to SSN 710.
- Feb 94 - Last major hull section for the SSN 21 was shipped from EB's Quonset Point, RI, facility to EB Division Groton, CT.
- May 94 - Pressure Hull Erect was achieved for SSN 21.
- May 94 - AN/BQG-5 completes at-sea performance evaluation (PERFEVAL).
- May 94 - The SSN 21 Class/BSY-2 Acquisition Program Baseline was approved. Revision reflects the third ship and incorporates Artic Mission Measures of Effectiveness.
- Aug 94 - AN/BSY-2 Program Replan implemented to definitize Stop Work Request for Request for Equitable Adjustment (REA).
- Aug 94 - Congress placed a Shipbuilding and Conversion, Navy cost cap on the SSN 21 and SSN 22.

b. (U) Significant Developments Since Last Report --  
SSN 21

- Dec 94 - SSN 22 Reactor Compartment, Section 6, was shipped from Quonset Point to Groton.
- Jan 95 - SEAWOLF Executive Oversight Committee (EXOCOM) is established to provide oversight and senior management attention on the SEAWOLF Program to deliver the lead ship and assure compliance with the cost cap.
- Jan 95 - Sonar Dome installation on the SSN 21 was completed.
- Feb 95 - Propulsor installation was completed and Pre-waterborne Alignment of the Main Propulsion Unit was completed on the SSN 21.
- Apr 95 - Float-off of the SSN 21 was accomplished.
- May 95 - AN/BSY-2 system completed System Design Certification Test (SDCT 1) with a successful 120 hour longevity test.
- Jun 95 - Initial design was completed for the SSN 21 Class.
- Jun 95 - SSN 21 Ceremonial Launch was held.
- Aug 95 - Completed Post Core Hot Ops for the SSN 21 Propulsion

\*\*\* UNCLASSIFIED \*\*\*

SSN 21 CLASS/BSY-2, December 31, 1995

7b. (U) Program Highlights (Cont'd):

Plant.

- Nov 95 - Completed Power Range Testing of SSN 21 Propulsion Plant
- Dec 95 - SSN 23 Appropriated, Construction started at Quonset Point facility.

AN/BSY-2

- Mar 95 - Delivery of SSN 21 shipset for installation at General Dynamics/Electric Boat Shipyard, Groton.
- May 95 - AN/BSY-2 Material Support Date (MSD) reached.
- Jun 95 - System Design Certification Test 1 (SDCT-1) complete.
- Jul 95 - Initial Software delivered to SSN 21, system lightoff achieved on 15 July with tactical training commencing the same day.
- Sep 95 - Crew training is successfully accomplished using On Board Training (OBT).
- Oct 95 - Consolidated Shore Facility (CSF) is operational and is used to augment SDCT-2 integration and test assets.
- Dec 95 - AN/BSY-2 Program Operation and System Support (POSS) contract awarded to Lockheed Martin Corporation.

THIS SYSTEM WILL SATISFY MISSION REQUIREMENTS.

c. (U) Changes Since As Of Date --

- Feb 96 - SSN 21 and SSN 22 Congressionally mandated cost cap was rescinded. SSN 21, SSN 22 and SSN 23 cost cap was established.
- Feb 96 - Operational Control of the AN/BSY-2 system officially transfers from the Shipbuilder to SSN 21 ship's force.

8. (U) Threshold Breaches:

The Final Software Delivery date breached the approved Acquisition Program Baseline dated May 26, 1994. The Program Manager's change in current estimate for Final Software Delivery to Navy to May 96 will not impact the shipyard schedule. This schedule adjustment will not impact the Program Manager's Estimate At Completion and is included in all current program planning. A deviation report is being submitted to record this change. There are no Nunn-McCurdy unit cost breaches.

SSN 21 CLASS/BSY-2, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

Support: Reduction of prior year funding  
AN/BSY-2 Stop Work Order  
AN/BSY-2 Team Trainer tactical equipment  
reprogrammed from FY91 OPN  
LSA conversion reprogrammed from FY91 O&M,N

Procurement  
Economic: Revised Indices  
Quantity: Deletion of 3 systems in FY94 as a result of large  
lot procurement (SSN21)  
Addition of 3 systems (FY98-2, FY99-1)  
Program Termination  
Restoration of SSN 22 (June 92)

Schedule: 3 systems in FY92 to FY93 (SSN21)  
Change in acquisition strategy reflecting 75%  
reduction in planned submarine construction  
workload

Estimating: Refined Program Requirements and large lot  
procurement savings (SSN21)  
Refinement of estimates to reflect later  
contract/pricing data (SSN21)  
Reduction in quantity due to program termination  
Reestimates for SCA process  
Corrections to original recission data  
Adjustment for current & prior year inflation

Support: Revised Outfitting and Post Delivery requirements  
(SSN21)  
FY91 AN/BSY-2 Team Trainer reprogrammed to RDT&E  
(AN/BSY-2)  
Revised cost estimates for Maintenance Trainers,  
Team Trainer Tactical and Trainer Unique Equipment,  
and associated spares (AN/BSY-2)  
Addition of OPN costs  
OF/PD Refined Cost Estimate  
Program Termination  
Two AN/BQG-5 Team Trainers (TTs) deleted (AN/BSY-2)  
Revised test equipment and spares estimates  
(AN/BSY-2)  
Reduced SSF configuration and upgrades; reduced  
Trainer Unique Equipment (TUE) for FY93 and FY94  
(AN/BSY-2)  
Deleted AN/BQG-5 Maintenance Trainer (MT), 2 TTs,  
Intermediate Maintenance Activity (IMA) and  
associated Maintenance Assistance Modules (MAMs)  
and Associated Spare Parts Kits (ASPKs) (AN/BSY-2)  
Deleted AN/BSY-2 MT #2, 2 TTs and spares, 2 new  
Module Screening And Repair Activities (MSRAs) and  
changed 2 new MSRAs to upgrades (AN/BSY-2)

| Target                 | Ceiling  | Qty |
| \$965.5                | \$1097.7 | 2   |

| Current Contract Price |          |     |
|------------------------|----------|-----|
| Target                 | Ceiling  | Qty |
| \$1052.4               | \$1196.6 | 2   |

| Estimated Price At Completion |                 |
|-------------------------------|-----------------|
| Contractor                    | Program Manager |
| \$1134.4                      | \$1135.5        |

|   | Cost Variance | Schedule Variance |
|---|---------------|-------------------|
| Previous Cumulative Variances           | \$-25.3       | \$-5.4            |
| Cumulative Variances To Date (10/01/95) | \$-30.1       | \$-1.8            |
| Net Change                              | \$-4.8        | \$3.6             |

Explanation of Change:

The unfavorable \$4.8M change in cost variance is primarily attributed to increased test and integration costs in Weapons Subsystem Integration, Core Integration, and BSY-2 System Design Certification Test (SDCT). The favorable \$3.6M change in schedule variance is primarily attributed to completion of software test milestones in Weapon Launch Display and Control, Weapon Launch Management, Workstation Database Manager, Common Combat Data Manager, Data Management Support, Workstations, and Signal Processing. Since the last SAR, the Program Manager's estimated price at completion and the Current Contract Target Price increased by \$0.1M due to various Engineering Change Proposal (ECP) activity.

Note: The initial and current contract prices and estimated prices at completion do not include the \$37.9M performance incentive fee pool. Option Items 0039, 0001-0018 and 0031 have been exercised and are included in the current contract prices.

Explanation of Change:

All numbers include anticipated escalation.

The Current Contract Ceiling Price is lower than the Program Manager's Estimate Price at Completion (PMEPAC) because the PMEPAC includes future contract changes.

The change in cost variance since last year is attributable to the following factors: material availability, labor hour performance (Outside Electricians, Outside Machinists, and Pipefitters, etc.), and the effects of the shrinking shipbuilding industry. The schedule variance reflects the volume of work remaining on the SSN 21. The Program Manager, Design Yards and the Shipbuilder continue to aggressively resolve design and material issues to support the construction program. As the SSN 21 approaches delivery, work arounds are more difficult. Work arounds are also hindered by the Congressionally mandated cost cap.

15. (U) Contract Information (Cont'd):

Explanation of Change:

All numbers include anticipated escalation.

The Current Contract Ceiling Price is lower than the Program Manager's Estimate Price At Completion (PMEPAC) because the PMEPAC includes future contract changes.

The change in cost variance since last year is primarily attributed to the SSN 22 phasing based on SSN 21. The schedule variance is due to the hull sections being retained at Quonset Point to maintain essential trades to bridge to New Attack Submarine, thereby precluding achievement of planned schedule at Groton.

The SEAWOLF Class Detail Design Contract N00024-87-C-2046 is over 90% complete and will no longer be reported.

16. (U) Program Funding Summary (Current Estimate in Millions of Dollars):

a. (U) Program Status —

(1) Percent Program Completed: 72.7% (16 yrs/22 yrs)

(2) Percent Program Cost Appropriated: 90.0% (\$11815.7 / \$13124.3)

b. (U) Appropriation Summary (Then-Year Dollars in Millions)

18a. (U) Operating and Support Costs (Cont'd):

a. (U) Assumptions and Ground Rules --

The O&S cost driving characteristics for the SEAWOLF Class are that each ship has a 30 year service life, displaces 9150 tons, has a crew of 134 officers/enlisted and a maintenance cycle which has 2 overhauls and 6 SRAS. There are 42 months between depot level availabilities. (The source for the cost information is the CAIG - Cost Analysis Improvement Group report dated 30 April 1990.)

b. (U) Costs -- (FY 1990 Constant (Base-Year) Dollars in Millions)

PE 0207219F, 0604239F

NOTE: PE 0604239F is the only RDT&E program element with funding after FY 91. PE 0207219F is the procurement program element. The other PEs are shown for information as they are included in the total program funding.

5. (U) Related Programs: None.

6. (U) Mission and Description:

The F-22 program will develop the next-generation air superiority fighter for introduction in the early 2000s to counter emerging proliferating world-wide threats. The F-22 is designed to penetrate enemy airspace and achieve a first-look, first-kill capability against multiple targets. F-22 Engineering and Manufacturing Development (EMD) is based on the Weapon System Specification formulated from data developed during the Demonstration/Validation (Dem/Val) phase. The EMD program consists of design, fabrication, and development testing of 13 EMD flight test vehicles (11 single and 2 dual seat); design, fabrication, development testing, and delivery of 39 EMD flight qualified engines; update of the Dem/Val Avionics Flying Laboratory into a Flying Test Bed for use in developing and integrating the EMD avionics suite; and design and development of F-22 support and training systems. The F-22 program from the outset has placed balanced emphasis on performance, survivability, reliability/maintainability, and affordability. The F-22 is characterized by a low observable highly maneuverable airframe, a new engine capable of supersonic cruise without using afterburner, and advanced integrated avionics.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

The Advanced Tactical Fighter (ATF) Demonstration/Validation phase involved two competing aircraft teams, led by Lockheed (with General Dynamics and Boeing as team members) and Northrop (teamed with McDonnell-Douglas), and two competing engine contractors, General Electric (GE) and Pratt & Whitney (P&W). Each aircraft team flew two prototype air vehicles--one with GE engines and the other with P&W engines. On 23 April 1991, the Secretary of the Air Force announced the winners of the ATF Engineering and Manufacturing Development (EMD) Source Selection: Lockheed Aeronautical Systems Company (LASC) for the air vehicle and overall weapon system integration and P&W for the engine. In conjunction with the selection, the ATF was redesignated the F-22. Milestone II approval

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

7a. (U) Program Highlights (Cont'd):

was confirmed by an Acquisition Decision Memorandum (ADM), dated 1 August 1991, authorizing F-22 EMD and long lead procurement for four pre-production verification (PPV) air vehicles. EMD contracts were awarded to LASC and P&W on 2 August 1991. In December 1992, Lockheed Aeronautical Systems Group, parent company of LASC, acquired General Dynamics' Fort Worth Division, which was renamed Lockheed Fort Worth Company (LFWC). In FY93, a combination of government and contractor funding shortfalls led to a rephase of the F-22 program. This rephase reduced the number of EMD aircraft from eleven to nine and the number of engines from 33 to 27. In addition, the EMD program schedule slipped twelve months and the production program slipped one fiscal year. The Air Vehicle Preliminary Design Review (PDR) was completed on 30 April 1993. Further funding reductions led to a second rephase of the program in FY94, slipping the EMD and production programs an additional eight months. The Air Vehicle Critical Design Review (CDR) was conducted on 20-24 February 1995. A \$110M FY95 Congressional and \$200M FY96 Office of the Secretary of Defense budget reduction led to a third rephase of the F-22 EMD program. Schedule impacts from these reductions, which assume funding payback within the Future Year Defense Plan starting in FY98, slipped first flight 3 months, extended EMD test aircraft deliveries, and extended EMD program completion 6 months with commensurate slips in Milestone III, Initial Operational Capability and the production program.

b. (U) Significant Developments Since Last Report --

The third rephase of the Engineering & Manufacturing Development (EMD) program, caused by the \$110M FY95 Congressional and \$200M FY96 OSD budget reductions and cost growth, increased the total program cost approximately \$950M (\$693M attributed to budget reductions and \$257M to cost growth) and resulted in four breaches of schedule. Schedule breaches included completion of Development Test & Evaluation (from Mar 01 to Oct 01), Low Rate Initial Production First Delivery (from Sep 00 to May 01), Start of Dedicated Initial Operational Test & Evaluation (from Mar 01 to Oct 01) and High Rate Production Contract Award (from Apr 02 to Feb 03). The F-22 System Program Office submitted an amended Program Deviation Report and a Baseline Change Request, on 22 December 1995, as a result of the funding shortfall and the Air Force Chief of Staff directed F-22 Logistics Privatization Study (LPS). The LPS indicated budgeted organic depot investment was planned to begin 3 to 5 years before sufficient operational experience data would be available to fully justify such an investment. Consequently, the Air Force directed that organic depot be delayed 3 years past the originally planned start date of 2001 and that the program adjust appropriate budget requests accordingly. This direction required a baseline schedule change in Organic Depot Activation (from Dec 06 to Dec 09) with

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

7b. (U) Program Highlights (Cont'd):

commensurate threshold changes.

The National Research Council completed its report on Live Fire Test (LFT) of the F-22 and recommended that Congress grant the Secretary of Defense authority to waive the requirement for full-up LFT. We understand action is underway to reintroduce legislation permitting the Secretary of Defense to waive the requirement post Milestone II. Though the report did not recommend a full-up test, it did suggest some changes to the current F-22 LFT program. We are currently incorporating these changes into the LFT plan and Test and Evaluation Master Plan.

Assembly of Air Vehicle (A/V) #4001, the first EMD vehicle, began in Fort Worth, TX, on 27 June 1995. Metrics used to monitor F-22 and F119 progress toward first flight have been developed and were initially reviewed at the program level during the September Program Management Review (PMR). In addition to monitoring the start and stop of each Integrated Master Schedule task associated with first flight, we are tracking a number of other metrics, including measures related to design, build, certification/qualification/flight clearance tasks, software and equipment deliveries. Metrics are reviewed bi-weekly by senior program officials.

On 7 September 1995, AFPEO/TA and SAF/AQ chaired a Strategic Roundtable, the first major step on the path to contracting for Pre-Production Verification (PPV) aircraft. Attendees, including OSD (S&TS), SAF/AQ and ACC/DR, received a strategic-level briefing on our approach for transitioning the F-22 from EMD to production. The briefing covered the impact of changes in the acquisition environment on our production strategy and the roadmap to the PPV contract. The next step in the process, a combined Tactical Roundtable and Acquisition Strategy Panel, is projected for February 1996.

In October 1994, we discovered an error in pressure distributions in the forward section of the inlet ducts. This forced us to revise airframe design loads and modify the affected structure to minimize flight test limitations. In order to preserve First Flight in May 1997, we implemented a block design approach in which the first two EMD test aircraft (Block 1) would be modified to regain static strength capability with service life reductions being a fall-out. The remaining aircraft (Block 2) will be modified to achieve full 8000 hour design life. To reduce cost and schedule impacts, Block 1 repairs were limited to parts having greater than 10% negative static margins and a further assessment was performed to determine if these aircraft would meet an acceptable flight test envelope. Our Test and Airframe Integrated Product Teams established an acceptable Block 1 flight test envelope which allows us to meet all EMD flight test

- 4 -

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

7b. (U) Program Highlights (Cont'd):

requirements.

The strike by the Boeing International Association of Machinists, which began on 6 October 1995, was settled on 13 December 1995. Boeing performed superbly during the strike by using management personnel on the production floor to keep A/V #4001 component production on track. Although the wing and aft fuselage schedules supporting delivery of A/V #4001 have been protected, it appears that A/V #4002 and #4003 are approximately 57 and 56 manufacturing days behind, respectively, due to the strike. Planning is underway to minimize first flight impacts for these two aircraft.

The F-22 Training System Integrated Product Team defined options for a suite of training devices that will meet all functional requirements. Cost analyses were finalized and a media recommendation briefing was presented to ACC/DR in October 1995. Media recommendations were approved by ACC/DR, and Boeing is proceeding with requests for proposals to the training industry.

Endurance testing of the Initial Flight Release (IFR) F119 engine configuration began in November 1995. After 380 total accumulated cycles and 140 hours of engine operation, borescope inspection revealed the high pressure turbine blades endured extensive erosion. Data analysis identified a loss of cooling pressure to the high pressure turbine blades and root cause analysis is underway focusing on the design integrity of the turbine mini-disk. Endurance testing will resume in February 1996. In on-going testing, progress was made in a design approach to improve the high power compressor stall margin shortfall. Potential design modifications were tested in December with more testing to be done in February 1996. At this time, we do not see an impact in meeting our engine first flight need delivery schedules. The Initial Service Release configuration Hollow Fan Blade (HFB) vibratory verification test is scheduled for February 1996 to assess the reduced stress level on the first stage HFB. Along with recent inlet case tests at Arnold Engineering and Development Center and P&W, Florida, the demonstration of inlet guide vane changes and scheduling control logic, will confirm HFB performance capability for First Flight and allow us to eliminate the solid blade design contingency in February 1996. For engine test results see Section 7c. which follows.

The F-22 as currently planned will meet all mission requirements.

c. (U) Changes Since As Of Date --

As a result of strong support from senior USAF leadership, the F-22 program received a \$100M plus up in FY96 from Congress. The F-22 program was exempted from bills for Bosnia support and a portion of

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

7c. (U) Program Highlights (Cont'd):

the assessment for Small Business Innovative Research. These actions resulted in a net increase to the FY96 Engineering Manufacturing and Development (EMD) funding of \$56M. This funding increase was used to offset funding the requirement for Rephase III from \$1260M to \$1204M.

Of the \$1204M total, \$1097M is funded in the FY97 President's Budget. The remainder to be funded in the FY98 Program Objective Memorandum.

Engine testing of the hollow fan blade showed that the inlet guide vane seal eliminated flutter and reduced vibratory stresses to acceptable levels. All flight test engines will have hollow fan blades. The F119 High Pressure Compressor Stall Margin shortfall analysis is focused on thermal induced distortions in the compressor/diffuser cases, resulting in non-uniform blade-to-case clearances and rubs. Engine FX625 was modified to incorporate mechanical design changes to compressor flange attachments and heat shields. These improvements proved to ensure an acceptable stall margin for stable unrestricted flight testing. The changes are being incorporated into the flight test engines within current schedules. Further modifications for improved stall margin in the Initial Service Release configuration are planned. The root cause of the High Pressure Turbine (HPT) mini-disk design deficiency discovered in December is attributed to a transient thermal mismatch between the mini-disk and the HPT disk snap fit. The HPT mini-disk has been redesigned for flight test to resolve its durability shortfall. A final Initial Flight Release design will be tested in April. All engine development issues identified to date have been resolved and the resolution demonstrated. The engine is on track for first flight in May of 1997.

There are several Air Vehicle components that have the potential to be Diminishing Manufacturing Resources (DMR) in the future. A majority of the currently identified parts are electronic components. A draft DMR plan has been developed and is currently being finalized. A Senior Level Review Team was also established with our prime contractors to develop the most cost effective program plan to mitigate the diminishing manufacturing resources challenge. DMR is a defense industrial base issue and not unique to the F-22 program. We are working with the contractor and government communities to mitigate the impact of DMR.

The decision was made to move the PPV funding from the 3010 to 3600 appropriation in accordance with USD(A&T) policy for funding low rate initial production articles dedicated to test. The F-22 SPO is currently revising the acquisition strategy. This change has no program cost or schedule impact.

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

7c. (U) Program Highlights (Cont'd):

Lockheed Martin (LMAS) presented revised A/V #4001, #4002 & #4003 manufacturing schedules in Feb 96. A/V #4002 & #4003 schedules slipped 57 and 56 manufacturing days, respectively, due to impacts of the International Association of Machinists strike at Boeing. The revised schedules also incorporate the Block 2 loads fixes on the aircraft. AV #4001 is on track for first flight. The F-22 team continues to proactively identify and resolve manufacturing, development and other schedule issues and is on track to meet major program milestones.

8. (U) Threshold Breaches:

There are currently no Munn-McCurdy unit cost breaches, but, as noted in Sections 7 and 9 as well as the previous Selected Acquisition Report, the ongoing rephase of the EMD program will cause breaches in several schedule milestones in the Acquisition Program Baseline dated 11 September 1995. Breaches due to the rephase include Completion of DT&E, LRIP First Delivery, Start of Dedicated IOT&E, and High Rate Production Contract Award. We also report a schedule slip of our Organic Depot Activation as a result of the Air Force Chief of Staff directed Logistics Privatization Study. We submitted an Amended Program Deviation Request and Baseline Change Request in December 1995.

b. (U) Previous Change Explanations --

Air Combat Command (ACC) determined the original Approved Program dates for Initial Operational Capability (OCT 02) and Organic Organizational Maintenance Capability (OCT 02). These were first reported in the December 1992 SAR.

The original Approved Program date for Organic Depot Activation (OCT 05), first reported in the December 1992 SAR, reflected the coordinated position of the F-22 SPO and the depot organization (SM-ALC).

The Current Estimates for Preliminary Design Review Complete through Required Assets Availability were updated in the December 1992 SAR to reflect the impacts of the 1993 program rephase.

The Approved Program dates for Critical Design Review Complete and all subsequent milestones were slipped eight months to reflect the impacts of the 1994 rephase. The Current Estimates in the December 1993 SAR accounted for these impacts.

Current Estimates for production-related milestones, beginning with PPV Long Lead, slipped four months in the December 1994 SAR, reflecting the FY96 Program Objective Memorandum's movement of the first F-22 production funding from FY96 to FY97.

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

9b. (U) Schedule (Cont'd):

Current Estimates reflected projected schedule breaches for Completion of DT&E, LRIP First Delivery, Start of Dedicated IOT&E and High Rate Production Contract Award, as shown in Section (9a), due to the impacts of the ongoing F-22 EMD program rephase. A Baseline Change Request with firm schedule estimates was submitted in December 1995.

c. (U) Current Change Explanations --

(Ch-1) Current Estimates reflect our best schedule estimates. As noted in Section 8, we identified a 3 year schedule slip for Organic Depot Activation based on the Air Force Chief of Staff Logistics Privatization Study recommendation and submitted a Baseline Change Request on 22 December 1995.

d. (U) References --

(U) Development Estimate:  
Defense Acquisition Executive (DAE) approved Acquisition Program Baseline (APB), 3 February 1992.

F-22, December 31, 1995

10a. (U) Performance Characteristics (Cont'd):

## Current Estimate is better than threshold.

### A mission scenario was assumed for estimating purposes. The current estimate will be updated when the scenario is refined.

USD(A) Risk Assessment Items are included here for consistency with the MS II APB. While these items may provide some insight to program maturity, they are not considered critical performance parameters, and, individually, should not be construed as good indicators of overall program health.

b. (U) Previous Change Explanations --

Current Estimates in the December 1992 SAR were set equal to the threshold values, as the program had just entered the development phase. Changes to the Current Estimates between December 1992 and December 1995 were based on development data not previously available.

c. (U) Current Change Explanations --

(Ch-1) Reflects changes to Subsonic Mission Radius and Supercruise Maneuverability in the Acquisition Program Baseline (APB) as of September 11, 1995.

(b)(1)

d. (U) References --

| Total Then-Year \$       | 99109.0                 | 72364.9             | 70093.1             |
| b. (U) Quantity --       |                         |                     |                     |
| Development (RDT&E)      | 0                       | 0                   | 4                   |
| Procurement              | 648                     | 442                 | 438                 |
| Total                    | 648                     | 442                 | 442                 |

Note: Excludes 11 RDT&E prototypes from the SAR Baseline and 9 from the Current Estimate that are not considered fully configured.

Note: CCP 0015 (Rephase 1) reduced RDT&E prototypes from 11 to 9. SAF/AQ decision, in accordance with USD(A&T) policy, moved 4 Pre-Production Verification (PPV) articles from the Procurement appropriation to the RDT&E appropriation increases the total RDT&E prototypes from 9 to 13. Therefore, the procurement quantity is reduced from 442 to 438.

Out year impact of FY96 OSD budget reductions to RDT&E account are not completely included in FY97 President's Budget profile. FY98-03 Program Objective Memorandum disconnect must be submitted to cover the remaining RDT&E shortfall.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised economic escalation indices and economic adjustment for negative program change.  
Quantity: Deleted 2 EMD aircraft and 6 EMD engines due to FY 93 funding shortfall.  
Schedule: Program rephase resulting from FY 93 funding shortfall stretched development one year.  
Engineering: 1000 lb JDAM integration.

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

**Estimating:** Changes due to contractor specific configuration, weight, and composite complexities following the RMD downselect to a single air vehicle/integration contractor and a single engine contractor. Impact of the FY94 rephase due to funding reductions, POM disconnects, FY95 congressional reduction (\$110M), and FY96 OSD reduction (\$200M). Adjustments also included for test refinements, program refinements, adjustments for current and prior inflation, current and prior year escalation changes, and Small Business Innovative Research (SBIR). Estimate refined based on development data not previously available.

**Support:** Change due to increased factor base.

**Procurement**

**Economic:** Revised economic escalation indices and economic adjustment for negative program change.

**Quantity:** Quantity variance resulting from decrease of 206 units.

**Schedule:** Schedule variance resulting from FY 93 funding shortfalls, quantity allocation, and recategorized to correct error in Dec 92 SAR. Slip of 1 year in production due to funding reductions.

**Engineering:** Addition of 1000 lb JDAM requirement.

**Estimating:** Program refinements.

**Support:** Variance associated with inclusion of Interim Contractor Support (ICS) and Common Support Equipment (CSE), a decrease of 206 units, and recategorized to correct error in Dec 92 SAR. Adjustments also include estimating factor adjustment in initial spares, and estimate refinements in both Peculiar Support Equipment (PSE), and other weapon systems cost.

**MILCOM**

**Economic:** Revised economic escalation indices, and adjustments for negative program change.

**Engineering:** Increase due to the addition of a level 4 data lab, and an additional environmental requirement.

**Estimating:** Variance based on revised depot requirements, and an estimate refinement. Revised estimating methodology from cost per wing to cost per squadron, revised beddown plan, cost realignment, and an adjustment for current & prior inflation.

Explanation of Change:

Explanation of Change:

The \$+157.1M Net Change cost variance through December 1995

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

15. (U) Contract Information (Cont'd):

represents a positive change since the June 1995 report due to rebaselining of the contract. The rebaselining efforts began in June 1995 and was completed in October 1995 with the last major supplier resetting the cumulative cost variances to zero. Note the cumulative cost variance does not include an unfavorable cost variance of \$181.2M which existed prior to the June 1995 cost growth baseline implementation. This note will appear in all future submissions of the Selected Acquisition Report to ensure its visibility is not lost.

The cumulative cost variance to date of \$-24.2M is largely driven by negative performance within airframe and utilities & subsystems. The airframe cost variance has increased as a result of late-to-need parts and schedule compression due to the machinist strike at Boeing. In addition, Block 2 loads impacts on Block 1 aircraft has contributed to the airframe cost increase. The utilities & subsystems cost variance is primarily attributed to subcontractor performance for the auxiliary power system and the electrical power system.

The \$+11.3M Net Change schedule variance through December 1995 represents a positive change since the June 1995 report due to rebaselining of the contract. The rebaselining efforts began in June 1995 and were completed in October 1995 with the last major supplier resetting the cumulative schedule variances. Note the cumulative schedule variance does not include an unfavorable schedule variance of \$59.4M which existed prior to the June 1995 cost growth baseline implementation.

The cumulative schedule variance to date of \$-74.7M is largely driven by negative performance within airframe, avionics, and utilities & subsystems. The airframe schedule variance has increased as a result of schedule compression due to the machinist strike at Boeing and late-to-need parts. The avionics schedule variance is due to subcontractor performance for the communication, navigation, & identification system; the electronic warfare system, and controls & displays system. The utilities & subsystems schedule variance is primarily attributed to subcontractor performance for the auxiliary power system and the environmental control system.

The decrease in Lockheed's Estimated Price At Completion is due to reducing the authorized unpriced work related to cost growth and rephasing the program. The decrease in the Program Manager's Estimated Price at Completion is primarily due to the rephase and cost growth proposal being less than originally estimated. The Program Manager's Estimate at Completion is based on the cumulative cost and schedule performance indices and adds target profit, known risk, planned changes, and maximum award fee possible.

\*\*\* UNCLASSIFIED \*\*\*

F-22, December 31, 1995

15. (U) Contract Information (Cont'd):

The increase in the Current Contract Price since the June 1995 SAR reflects additional award fee earned during the period.

|   |          |         | Cost Variance                 | Schedule Variance |
| Previous Cumulative Variances             |          |         | \$-36.8                       | \$-19.5           |
| Cumulative Variances To Date (12/31/95)   |          |         | \$-0.3                        | \$-21.0           |
| Net Change                                |          |         | \$36.5                        | \$-1.5            |

Explanation of Change:

Through December 1995 the cumulative unfavorable cost variance was \$0.3M (0.0%). This is an improvement of \$36.5M from the June 1995 SAR. This improvement can be attributed to rebaselining of the contract that removed \$41.3 unfavorable cost variance. The current cumulative cost variance is related primarily to problems encountered in manufacturing the hollow fan blade and inlet cases.

Through December 1995 the cumulative unfavorable schedule variance was \$21.0M (1.7%). This variance represents a decline of \$1.5M from the June 1995 SAR. The rebaselining of the contract removed \$21.9M unfavorable schedule variance. The drivers of the current cumulative schedule variance are: fan and inlet case delivery problems; late verification testing in the controls and diagnostics systems; and late parts delivery for the nozzle.

The \$40.0M increase in the Contractor's Estimated Price At Completion reflects the cost of realigning the Pratt and Whitney contract to Lockheed-Martin's rephased airframe contract. The Program Manager's estimated price at completion is based on the cumulative cost and schedule performance indices and adds target profit, known risk, planned changes and maximum award fee possible.

Note: Obligated and expended amounts reflect program office records as of 29 February 1996.

The USAF FY97 Program Objective Memorandum (POM) essentially deleted FY99-01 MILCON funding. The program office has submitted a POM disconnect to HQ ACC to cover FY99-01 requirements.

17. (U) Production Rate Data:

- a. (U) Deliveries to Date -- 0/0.
- b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

- a. (U) Assumptions and Ground Rules --

The Operating and Support (O&S) cost estimate has been updated to reflect current program structure as of 31 December 1995.

The F-22 concept of operation is an 18 aircraft fighter squadron with a utilization rate of 332 flight hours per aircraft per year. The wartime scenario was used to estimate the manpower requirements.

The peacetime utilization rate for the weapon system was used to estimate the O&S cost. Training and combat coded squadrons were addressed as operationally the same for this O&S estimate. Total aircraft buy for the F-22 cost estimate was 442.

b. (U) Costs -- (FY 1990 Constant (Base-Year) Dollars in Millions)

| Cost Element             | Avg Annual Cost Per<br>F-22 Squadron | Avg Annual Cost Per<br>F-15C Squadron |
|--------------------------|--------------------------------------|---------------------------------------|
| Unit Mission Personnel   | 14.6                                 | 23.1                                  |
| Unit Level Consumption   | 18.1                                 | 12.9                                  |
| Depot Maintenance        | 2.6                                  | 13.8                                  |
| Sustaining Support       | 1.6                                  | 19.0                                  |
| Installation Support Per | 0.0                                  | 3.1                                   |
| Indirect Support         | 6.1                                  | 7.7                                   |
| Depot Support            | 0.0                                  | 2.1                                   |
| Contractor Support       | 1.8                                  | 0.0                                   |
| Acquisition and Training | 0.0                                  | 8.2                                   |
| Total                    | 44.8                                 | 89.9                                  |

The F-15C is antecedent to the F-22; both are two engine air-to-air fighters with similar operational concepts. The F-15C concept of operation is a 24 aircraft fighter squadron with a utilization rate of 360 flight hours per year per aircraft. The wartime scenario was used to estimate the manpower requirements. The peacetime utilization rate for the weapon system was used to estimate the O&S cost. Training and combat coded squadrons were addressed as operationally the same for this O&S estimate. Total aircraft buy for the F-15C cost estimate was 648.

Both the F-22 and F-15C estimates were based on API 65-503 Cost and Planning Factors. There is no planned intermediate maintenance for the F-22 based on 2-Level maintenance concept. The variation in cost categories is representative of the Office of the Secretary of Defense Cost Analysis Improvement Group (OSD CAIG) dated May 92.

c. (U) Contractor Support Costs -- None.

Titan IV, December 31, 1995

**6. Mission and Description:**

The Titan IV is a heavy lift rocket booster that will assure continued access to space for the nation's highest priority space systems. The Titan IV program will not replace any defense programs. The Titan IV system evolved from the basic family of Titan systems, namely the Titan III and 34D, which have contributed to national space objectives for more than 25 years. The Titan IVA vehicle configuration consists of a two stage liquid propellant core with a pair of large, attached solid rocket motors (SRM) which provide the initial boost stage after liftoff. The new Titan IVB vehicle configuration with solid rocket motor upgrade (SRMU) and new avionics will provide increased reliability, producibility, and performance. The two upper stages baselined for use on the Titan IV are the Inertial Upper Stage (IUS) and the Titan/Centaur. When configured with the Centaur and SRMU, Titan IV is capable of placing an 11,500-pound payload into Geosynchronous Earth Orbit (GEO). When configured with No Upper Stage (NUS) and SRMU, Titan IV can place a 47,000-pound payload into a 100-nmi circular, polar orbit. The Titan IV was designated a Defense Acquisition Board (DAB) program in July 1991.

**7. Program Highlights:**

**a. Significant Historical Developments --**

Development of the Titan IV was in direct response to a National Security Decision Directive. The initial contract for 10 Titan IVs with Centaur upper stages was awarded in February 1985. As a result of the January 1986 Space Shuttle accident, the Department of Defense (DoD) began a recovery plan which included the acquisition of 13 additional Titan IVs. The resulting 23-vehicle program, placed on contract in December 1987, was structured to account for the impacts of the April 1986 Titan 34D accident and the June 1986 National Aeronautics and Space Administration (NASA)/Centaur cancellation. The DoD later embarked on an increased capacity plan which included an additional launch pad at Cape Canaveral Air Station (CCAS), 18 additional Titan IV boosters, and associated facility enhancements. The current 41-vehicle program was definitized in December 1989. The Titan IV was designated a Defense Acquisition Board (DAB) program in July 1991. In September 1991, Production Slowdown I (PS I) reduced production from 10 to 5.5 vehicles per year to match reduced launch rate requirements; there were further reductions to 3 vehicles per year in June 1993 with Production Slowdown II (PS II) and 2 vehicles per year in January 1994 with the production "bridge." The Unified Payload Integration (UPI) contract was awarded in July 1992 to provide payload integration capability through FY97. The first Titan IV was successfully launched in June 1989 from CCAS. In April 1991, an explosion occurred during the static firing test of the SRMU Preliminary Qualification Motor No. 1 (PQM-1) causing significant damage to the test facility. SRMU casting began in November 1993 after all further tests were successful. A Titan IV vehicle launched

Titan IV, December 31, 1995

**7a. Program Highlights (Cont'd):**

from Vandenberg Air Force Base (VAFB) on 2 Aug 1993 experienced a failure caused by a burn through on one of the SRMs. The program successfully recovered with the launch of Titan IV-10/Military Strategic and Tactical Relay (Milstar) payload in February 1994, the first Titan IV/Centaur launch from Launch Complex-40 (LC-40) at CCAS. The first SRMU segment was delivered to VAFB on 14 Feb 94.

**b. Significant Developments Since Last Report --**

Four successful Titan IV launches occurred since last report including Milstar II and three classified payloads. The development of the Titan Master Contract Plan continues in order to break out Titan contracts into six separate contracts to better manage the program. The Acquisition Strategy Panel approved the System Program Office (SPO) plan in Mar 95. In Jul 95 a Stage II engine nozzle failed during a verification test which was necessitated by a vendor change. Recovery efforts are ongoing with no launch schedule impacts expected. The Titan IVB System Critical Design Review was successfully completed on 19 Oct 1995. Titan IVB Initial Operational Capability (IOC) is scheduled for Sep 1996. The Titan Single Acquisition Management Plan, which included an update to the Acquisition program Baseline (APB) to reflect a reduction in quantities from 65 to 47 vehicles, was approved by SAF/AQ on 22 Dec 95 and is awaiting OSD approval. The new production and launch operations follow-on contracts supporting the 41 vehicle program are expected to be awarded in Apr 96. The follow-on buy for up to five additional vehicles is expected to be awarded in Nov 96.

The Titan IV system will satisfy mission requirements.

**c. Changes Since As Of Date --**

The first Titan IVB core vehicle (Titan IVB-24) was shipped to CCAS on 23 Jan 1996. SAF/AQ approved business clearance on the Launch Operations and Production follow-on contracts (-0012 and -0001) on 8 Mar 96. The Titan IV program was reduced from 47 to 46 vehicles based on Program Budget Decision (PBD) 604 to select the DSP 23 mission as the low risk payload flight for the Evolved Expendable Launch Vehicle (EELV) program in FY 03. Titan IV reductions to the FY 97 President's Budget in conjunction with an Air Force Space Command (AFSPC) operational effectiveness assessment have led to direction to delete the Centaur Processing Facility (CPF) capability and associated CPF IOC milestones from the Titan IV Acquisition Program Baseline (APB).

**8. Threshold Breaches:**

There are no breaches to the approved Defense Acquisition Executive (DAE) Acquisition Program Baseline (APB) dated 26 May 94, and no Nunn-McCurdy Unit Cost Breaches.

Note: Space Launch Complex-40 (SLC-40) is referred to as LC-40 throughout this document.

b. Previous Change Explanations --

Due to favorable progress driven by the Preliminary Design Review, the Systems Critical Design Review (CDR) was held one month ahead of schedule.

Progress made by the core contractor allowed delivery of the first core to CCAS ahead of schedule. However, delays in deliveries of the payload fairing and solid rocket motors caused a delay in delivery of the final vehicle components from February to April 1988. The delay in the Titan IV/NUS Western Test Range (WTR) ILC at VAFB to December 1990 was caused by the requirement for additional electrical modifications to the Mobile Service Tower (MST) and the need to complete ground systems tests. The Titan IV/NUS WTR ILC was subsequently achieved two months early in October 1990.

The initial Centaur ILC structural test (July 1989) was completed in November 1989. Additional Centaur tests were completed in April 1991.

The delayed launch of the first Titan IV caused a slip in the TIV/Centaur ILC due to derived scheduling conflicts. A further slip occurred from August 1991 to November 1991 due to a launch delay of Titan IV-6. The delay impacted facility modifications necessary for Centaur. An additional slip from August 1991 to November 1991 due to Centaur separation ring redesign and test in preparation for the ILC and a May 1991 Atlas Centaur flight failure (AC-70). A further slip

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Titan IV, December 31, 1995

9b. Schedule (Cont'd):

from November 1991 to February 1992 resulted from additional inspections for contaminations resulting from the Commercial Atlas/Centaur (AC-70) failure investigation. The next slip from February 1992 to December 1992 was due to an acceptance test failure of the Digital Computer Unit. The next slip from December 1992 to June 1993 was due to assessment of the August 1992 AC-71 failure and user direction. Titan IV/Centaur ILC was successfully achieved during September 1993 which was a slip from February 1993 due to implementation of AC-71 failure fixes.

The requirement for a second VAFB launch pad (SLC-7) was deleted. Previous LC-40 ILC of fourth quarter FY 92 was further refined to reflect a July 1992 ILC. LC-40 ILC was successfully achieved on 28 February 1993.

A crane accident in September 1990 at Edwards AFB damaged the test stand, delaying the PQM-1 test until April 1991, and the SRMU ILC until May 1992. The SRMU static firing (PQM-1') slipped from February 1991 to April 1992 because of the SRMU PQM-1 test explosion occurring on 1 April 1991. The PQM-1 test failure also delayed the SRMU ILC from May 1992 to August 1993. The SRMU static firing (PQM-1') slipped from April 1992 to May 1992 due to production schedule delays for the test "aft skirt" which is the attachment between the SRMU and the test stand. The SRMU static firing (PQM-1') further slipped from May to June 1992 due to weather conditions (i.e. winds) at the test site. PQM-1' was successfully tested on 12 June 1992. The SRMU ILC was delayed from August 1993 to July 1994 due to further delays in the qualification test program. Delays in the development of the Flight Termination System (FTS) further delayed SRMU ILC from July 1994 to July 1996.

IOC of the Centaur Processing Facility was delayed from September 1995 to January 1997 due to FY 94 budget cuts and delays in awarding the military construction contract.

| Payload to Transfer Orbit (k-lbs)                          |      |  |                           |                     |        |
| SRM  | N/A  | 38.8 / 38.8                                | 39.3                      | 39.3                |        |
| SRMU   | N/A  | 47.0 / 47.0                                | 47.0                      | 47.0                |        |
| Payload to Low Earth Polar Orbit (k-lbs) (Titan IV/MUS)    |      |  |                           |                     |        |
| SRM  | N/A  | 31.1 / 31.1                                | 31.4                      | 31.4                |        |
| SRMU   | N/A  | 38.8 / 38.8                                | 38.8                      | 38.8                |        |

Note: Although the Centaur structural limit for certain payloads to Geosynchronous orbit is 11.5 K-lbs, specific Titan IV Centaur/SRMU missions do exceed this capability. Therefore, no current direction or funding is required to modify the Centaur for increased capability. Demonstrated performance is based on test and analysis data for yet-to-be launched vehicle configurations (SRMU).

b. Previous Change Explanations --

Performance Objectives/Thresholds for payload to low earth polar orbit (Titan IV/MUS) were updated in the 9 June 1993 APB revision to reflect requirements in the 2 April 1991 System Operational Requirements Document (SORD).

Demonstrated performance for Titan IV System Reliability was increased from 88% to 91% due to two successful launches.

The demonstrated performance for Payload to Geosynchronous Orbit (Titan IV/Centaur) was reduced from 10.2 to 9.8 k-lbs. due to the results of recent Centaur engine testing. The resulting current estimate was also reduced from 10.2 to 10.0 k-lbs. due to the results of recent Centaur engine testing.

The 09 June 1993 APB added the Payload to Transfer Orbit section and deleted the previous section on Payload to Geosynchronous Orbit (Titan IV/IUS) SRM.

b. Previous Change Explanations --

RDTE&E

Economic: Revised economic escalation indices.

Schedule: Impact on integration costs due to program stretch-out from FY00 to FY05. Extended the program's procurement, delivery, and launch schedules from FY05 to FY14.

Engineering: Design effort for satellite dual compatibility; continued effort for a second west coast Titan IV launch pad development at VAFB, CA; SRMU development FY94-95; Preplanned Product Improvements (P3I) and range safety design modifications. Revised Flight Termination System block upgrade beginning on vehicle #24 and

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Titan IV, December 31, 1995

**13b. Cost Variance Analysis (Cont'd):**

lightning mitigation towers for LC-41. Range safety regulations required additional vehicle modifications. Program extension due to changes in user requirements through FY14 required upgrade and modernization of vehicle hardware. New requirement to requalify SRMU and decrease in number of vehicles from 65 to 47, increased hardware development costs. Elimination of upgrades reduced Continuous Product/Process Improvement (CPPI) costs.

**Estimating:** Recurring/nonrecurring payload integration revised estimates; Transfer to procurement of funds for previously designated shuttle missions; Transfer of outyear funds from procurement; Gramm/Rudman/Hollings reductions; Adjustment for outyear escalation; Lower Centaur unit price as a result of negotiations; Funding for Centaur development and projected contractor overrun, additional Federally Funded Research & Development Corporation (FFRDC) support for increased program scope, facility design support for the Solid Motor Assembly and Readiness Facility (SMARF) and Centaur Processing Facility (CPF); Payload integration increased program scope for FY96-97; Single Best Estimate (SBE) update for SRMU development amortization; reduced outyear mission model; addition of M Account funds to offset prior year overrun; deletion of SLC-6 development; negotiated cost adjustment for LC-40 and CPF; hardware storage, SRMU costs, and revised Payload Integration estimate due to program stretch-out. Future vehicle buy reconfiguration caused a reduction in launch vehicle, Aerospace Ground Equipment (Age), and integration costs. Age/Facility maintenance revised estimate. Payload integration and range safety compliance revised estimates. Adjustment for current and prior year Escalation.

**Support:** Additional support equipment for accelerated activation at the CCAS, FL, launch site; Facility design for the new Centaur Processing Facility and upgrades to the SRM testing facility at CCAS, FL; Second west coast launch pad modification to change from shuttle to Titan IV capability at VAFB, CA. Partial funding for LC-40 facility upgrade to protect Mars Observer mission schedule. SRMU Amortization, Working Capital Adjustment and Claims. New federal regulations requiring

\*\*\* UNCLASSIFIED \*\*\*

Titan IV, December 31, 1995

13b. Cost Variance Analysis (Cont'd):

development of hazardous waste management and pollution prevention programs. Current environmental law compliance revised estimate. Decrease in number of vehicles from 65 to 47 and program shortening from 2014 to 2011 reduced contractor engineering and management costs. Shortening of program also reduced program office support and engineering change costs.

Procurement

Economic: Revised economic escalation indices.

Quantity: Additional hardware costs (from 10 to 75 vehicles); Reduced vehicle quantity (from 75 to 65). Reduced vehicle quantity (from 65 to 47) reduced hardware and non Air Force Unified Payload Integration costs.

Schedule: Change due to rephasing of production build schedule; Accelerated buy of original 23 vehicles; Adjustments to vehicle launch requirements to comply with Oct 91 Space Launch Advisory Group (SLAG); Impact due to production slow down schedule. Delay in mission requirements deferred booster hardware procurement for vehicles 42 through 65 (42+) by at least one year. Procurement, delivery, and launch schedule extension resulted in continuation of sustaining engineering and launch services contract through FY14. Reduced launch capability and the shortening of the program from 2014 to 2011, reduced launch services costs.

Engineering: Additional hardware to accommodate satellite dual compatibility and mission requirements precluded Centaur upper stages; Initial hardware for an upgraded SRM; Mission requirements preclude the need to procure Centaur upper stages for eleven Titan IVs; Tooling to support an increased production rate at contractor's facility. Program stretch-out through FY14 required upgrade and modernization of vehicle hardware. Range safety regulations modifications required additional vehicle modifications. Decrease in the number of vehicles from 65 to 47 and shortening of the program from 2014 to 2011 reduced the cost of incentives and engineering changes. Elimination of upgrades reduced CPPI costs.

Estimating: Recategorization of Flyaway/Support cost reported in December 1985 SAR, Transfer from RDT&E of funds for previously designated shuttle missions;

\*\*\* UNCLASSIFIED \*\*\*

Titan IV, December 31, 1995

13b. Cost Variance Analysis (Cont'd):

Transfer of outyear funds to RDT&E; Centaur procurement due to STS/Centaur cancellation; Deletion of classified user operation and maintenance funds; Gramm/Rudman/Hollings reductions; Funding reductions due to budget cycle reviews; Unit price benefits of increased quantity buy; Adjustment for current and prior year escalation changes; Realignment to support programmatic changes; Increased government involvement in plant inspections; Additional tooling to support higher productivity capacity; Additional FFRDC engineering support as a result of increased program scope; Procurement of an additional payload fairing to support satellite integration on Titan IV; Contractor launch incentives required for additional vehicles; Propellant requirements for additional vehicles; Payload integration of additional missions; negotiation of the follow-on buy; Vehicle configuration changes; Revised contractor incentive plan; Multiyear rephase funding adjustment; Incremental funding adjustment; Communication equipment for second west coast pad at VAFB, CA; Addition of M Account funds for prior year overrun; Correction to Dec 90 SAR entry; Recategorization of Jun 91 SAR cost change from estimating to support; Cost impact of stretched program on incentives, propellants, manifest planning, integration and production cost. Additional storage supported reduction of launch requirements. Production rate slowdown from 5.5 to 3 vehicles per year resulted in increased cost for vehicles 42 through 65. Increase of stockfund prices for flight propellants. Added program improvements, CPPI and Industrial Modernization. Changes in future requirements for Centaur upper stages and launch vehicles resulted in revised hardware estimate. Shift of the 42+ Follow-on buy from FY 95 to FY97 resulted in increase in hardware and systems engineering costs. Revised estimate for facilities and ground equipment. Changes in future buy plans caused an increase in non-Air Force payload integration costs. Revised estimate included allowance for settlement of prior and out year contractor claims. Defense cutbacks caused changes to contractor business base, resulted in projected increased overhead rates. Delayed procurement and launch schedule resulted in revised engineering

\*\*\* UNCLASSIFIED \*\*\*

Titan IV, December 31, 1995

13b. Cost Variance Analysis (Cont'd):

change estimate. Revised estimate to maintain AGE and facilities through program life, to complete Range Safety improvements, and to settle prior and out year contractor claims.

Support: Accelerated support equipment procurement at CCAS, FL and recategorization of Flyaway/Support costs reported in December 1985 SAR; Initial AGE and communication equipment requirements supported launch requirements at CCAS, FL and VAFB, CA; AGE for second west coast launch pad at VAFB, CA; AGE requirements at CCAS, FL supported increased program scope and duration (includes new SMARF); Deletion of SLC-6 AGE and communication equipment; Transfer of launch processing costs from O&M to Procurement; Recategorization of Jun 91 SAR cost change from estimating to support; Correction to Dec 90 SAR entry; Updated estimate to reflect four additional years of launch operations and impacts to other support requirements; Additional technical support for SRMU production; Adjustment for current and prior year escalation offset. Revised estimate for launch operations, storage and sustaining engineering due to program stretchout. Disposition of Government-owned, contractor operated facilities. New federal regulations required the development of hazardous waste programs. Delays in launch schedule required additional vehicle storage. Program stretch-out required continued program office technical and management support. Program shortening and quantity reduction reduced contractor management and engineering cost. Reduced manpower requirements and shortening of program lowered cost of program office technical support. Quantity reduction reduced storage costs. Environmental law compliance revised estimate.

MILCON

Economic: Revised economic inflation indices.

Schedule: Change due to rephasing of build schedule.

Estimating: Adjustment for current and prior year escalation offset; Realignment of the second Titan IV launch pad costs into outyears; Funds added/realigned for SMARF and the CPF at CCAS, FL; Refined costs for CPF based on contractor proposal; Reduction in SLC-6 facility costs related to deletion of AGE and communication equipment requirements; Reduction in SMARF funding due to contract underrun. Revised estimate to complete construction of Solid Motor

| Net Change                              | \$64.4               | \$44.4                   |

Explanation of Change:

Explanation of current changes: Change from Dec 94 SAR in target price from \$11,568.8M to \$11,681.2M was due to various contract modifications. Examples of the largest contract modifications are: Non UPI Support Task Orders, Inertial Guidance Unit replacement, Phase II CCAS Launch Restoration, and Pyrotechnic Shock Values.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Titan IV, December 31, 1995

15. Contract Information (Cont'd):

The decrease in cost variance to date (\$64.4M) is due to: (1) Synergy savings associated with the General Dynamics Acquisition; (2) Continued good performance at McDonnell Douglas; (3) Continued good performance at CCAS and VAFB launch sites; (4) Better performance in systems engineering. The schedule variance increase \$44.4M is primarily attributed to: the Centaur schedule variance \$44.7M was eliminated to reflect the Production Slowdown II (PSII) contractual modification. The program was rebaselined setting cumulative BCWS equal to cumulative BCWP as of Jan 1995.

Note: Contract F04071-85-C-0019 is categorized as FPIF/CPFF/CPAF/AF/CS/CR/MSI/FFP and includes RDT&E, Procurement, and O&M.

Explanation of Change:

Explanation of change in target price (from \$675.5 to \$676.3M): Changes in both price and cost will occur throughout the duration of this contract. The contract is modified periodically, to support specific missions.

The \$12.7M change in cost variance on the -0028 underrun is due partly to work which was planned Level Of Effort (LOE), that is now planned discretely and partly to deferral of work relative to current mission requirements. The unfavorable schedule variance change (\$-2.7M) is due to rebaselining to realistic mission manifests. None of these variances are expected to adversely impact the cost at completion of this contract.

Titan IV, December 31, 1995

16c. Program Funding Summary (Cont'd):

procurement quantities in FY 85, 86, 96, and 97. From 2001 to 2011, there are no production quantities, but there are recurring costs which are associated with launch operations annual costs at Cape Canaveral and Vandenberg APB. These annual costs are contracted as a launch capability but are not tied to specific hardware units.

18. Operating and Support Costs:

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Titan IV, December 31, 1995

**18a. Operating and Support Costs (Cont'd):**

**a. Assumptions and Ground Rules --**

The costs for launch processing are based on actual contract values for the current Titan IV program and were transferred from operation and support costs to procurement costs in conjunction with the FY92/93 President's Budget. Thus, these costs are not included below. Range costs continue to be carried as operation and support costs. Range costs are based on current and historical data from the Titan IV and Titan 34D program. The updated Titan IV Program Office Estimate (POE) annual O&S costs were estimated to be \$71.8M in base year dollars. With a reasonable rate of four launches per year the average annual cost in base year dollars is \$18.0M. The Titan 34D data is historical data from old SARs.

**b. Costs -- (FY 1985 Constant (Base-Year) Dollars in Millions)**

| Cost Element  | Avg Annual Cost Per<br>Titan IV Launch | Avg Annual Cost Per<br>Titan 34D Launch |
|---------------|--|---|
| Range Support | 18.0                                   | 7.5                                     |
| Total         | 18.0                                   | 7.5                                     |

Note: All costs described in Section 18.b are "average cost per launch" and not "average annual"

**c. Contractor Support Costs -- None.**

4. (U) Program Elements/Procurement Line Items (Cont'd):

PROCUREMENT:

APPN 3010 ICN 27581F (Air Force)

MILCON:

PE 0604770F

5. (U) Related Programs:

Global Positioning System (GPS), Joint Tactical Information Distribution System (JTIDS), Single Channel Ground Air Radio System (SINCGARS), Inertial Navigation Unit (INU), E-8 (formerly C-18), HAVE QUICK, E-6, HAVE SYNC, Joint STARS Ground Station Module (GSM).

6. (U) Mission and Description:

The Joint Surveillance Target Attack Radar System (Joint STARS) is a Joint Army and Air Force Program, with the Air Force as lead service. The Joint STARS system provides real-time wide area surveillance of the battlefield and rear echelons. Joint STARS is unique because it detects and tracks enemy armor, vehicles, and troops over a wide-area in real-time using moving target indicator (MTI) and synthetic aperture radar (SAR) techniques. Joint STARS also provides precise real-time targeting information to direct attack aircraft, friendly artillery, and standoff missile batteries thereby reducing interdiction missions. Joint STARS unique capabilities can give the Corps Commander a near real-time look at enemy first and second echelon force buildups, force movements, and the enemy's scheme-of-maneuver on the battlefield. This early information on the enemy's battle plan will allow friendly forces to act before the enemy plan is executed and maneuver with economy of force to engage the enemy at a time and place of the Corps Commander's own choosing. There is no antecedent system.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

The Joint STARS Program resulted from a May 82 OSD/USDRE memorandum directing Air Force lead of a joint program with the Army to develop a single multi-mode target acquisition and weapon guidance system. Joint STARS was organized from PAVE MOVER and Standoff Target Acquisition System Program Offices. The Full Scale Development (FSD) contract for the airborne segment using the E-8A, a Boeing 707-300 series aircraft converted to military use, was awarded to Grumman Aerospace Corporation in Sep 85. The first Joint STARS FSD aircraft was delivered in Jul 87 and an OSD-directed Operational Utility Evaluation concluded the system would meet requirements.

The first flight test and the System Preliminary Design Review took place in Apr 88, followed by the Milestone IIB decision in Jul 88 which approved procurement of 21 new 707 aircraft as well as self defense and reliability improvements. In Dec 88 the first increment

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Joint STARS, December 31, 1995

7a. (U) Program Highlights (Cont'd):

of the Critical Design Review (CDR) was conducted and an operating radar was flown for the first time. An Acquisition Decision Memorandum in Nov 89 directed that used 707 aircraft, vice new, be used for the Joint STARS platform.

The Follow-on FSD (FOFSD) contract, which included a third FSD aircraft in a production configuration, was awarded in Nov 90. Both E-8A test aircraft and six Ground Station Modules (GSMs) were successfully deployed to Saudi Arabia for Desert Shield/Storm Jan-Mar 91.

Robins AFB, GA was selected as the Main Operating Base (MOB) in Apr 91. Program Management Directive 21, dated 29 Jul 91, reduced the program from 21 to 19 aircraft. A System Level Performance Evaluation in Sep 91 supported the exit criteria for an advance buy decision in Jan 92. A Nov 91 Four Star Summit addressed lessons learned in Desert Storm and the requirement for development and production representative aircraft to be maintained in a condition that would allow for deployment of two aircraft within 60 days to support contingency requirements.

The FOFSD System CDR was completed in Feb 93 leading to Defense Acquisition Board (DAB) authorization of three Low Rate Initial Production (LRIP) lots in May 93. Lot I full procurement contract was awarded in May 93 and Lot II Advance Buy in Jun 93. A major benchmark was reached in Nov 93 with the official delivery of two E-8A systems to the government. The E-8C first flight took place in Dec 93, after the 707-300 was refurbished and modified to the production configuration.

In Mar 94 the E-8C Follow-on Full Scale Development (FOFSD) aircraft flew its first system flight, demonstrating system capability in a modified sub-system configuration. Air Worthiness Testing was completed on an E-8A aircraft, configured like an E-8C, at Edwards AFB, CA in Jun 94.

The Low Rate Initial Production (LRIP) Lot II Full Procurement Contract was definitized in Jun 94 and an upgrade to the Tactical Digital Information Link (TADIL-J) was awarded in Jul 94.

An E-8A aircraft deployed to Europe in Oct 94 and successfully demonstrated the Joint STARS system to NATO decision makers. The FY95 Appropriation Bill provided \$99.9M to buyout and store up to 12 aircraft, allowing the program to purchase the best available airframes in the best possible market conditions.

\*\*\* UNCLASSIFIED \*\*\*

Joint STARS, December 31, 1995

7b. (U) Program Highlights (Cont'd):

b. (U) Significant Developments Since Last Report --  
The commanders of ACC and Army's TRADOC held a Four Star General Officer Review of the program in Jan 95. They are committed to the joint approach for development, fielding and operations.

In Feb 95, all flight testing in support of the Full Scale Development (FSD) was completed, clearing the way for the close-out of the ten year old FSD contract. The FSD close-out proposal was received and negotiated, paving the way for close-out of the FSD contract.

The Follow-On Full Scale Development (FOFSD) team completed Contractor Development Test and Evaluation (CDT&E) and Government Development Test and Evaluation (GDT&E) flight testing to achieve the DT&E Complete APB Milestone in Sep 95. The MOT&E certification briefing was completed in Oct 95 and the PEO subsequently declared the system ready for MOT&E. The MOT&E Start Milestone was achieved in Dec 95 with AFOTEC's formal acceptance of the weapon system for MOT&E.

The production team purchased three Canadian aircraft, the first of which was delivered to Grumman in Jun 95. Lot III was definitized, the Lot IV Long Lead Exit Criteria were satisfied and the Lot IV Long Lead contract was awarded in Jul 95. Dr. Kaminski approved the redesignation of Lot IV as LRIP and award of Lot V advanced procurement subject to Joint STARS satisfying exit criteria. An Acquisition Program Baseline (APB) was submitted and approved to change the Full Rate Production (FRP) Contract Award Milestone schedule to Jun 97/Nov97 (objective/threshold). The first production aircraft completed its first Functional Check Flight (FCF) in Aug 95 and was delivered to Melbourne in Sep 95 for integration of the Prime Mission Equipment (PME).

Supportability activities including stand-up of the 93rd Air Surveillance Wing continued throughout the year to meet the numerous upcoming Supportability Milestones. The joint Government/Contractor Team worked to define detailed schedule mileposts and linkages to mitigate schedule risks. The Flight Crew Training System (FCTS) Critical Design Review (CDR), held in Jul 95, identified delays in hardware integration and software development which have jeopardized the ability to meet the Flight Simulator Delivery Milestone. A Program Deviation Report was submitted to the Service Acquisition Executive (SAE) in Dec 95 for this APB milestone breach.

Joint STARS participated in the Paris Air Show in Jun 95. The aircraft was successfully demonstrated to more than 260 distinguished visitors. That same month, it was also demonstrated to the NATO

Joint STARS, December 31, 1995

7b. (U) Program Highlights (Cont'd):

National Armament Directors in Colorado Springs, CO. In Oct 95, Joint STARS supported the "Day at Sea" demonstration for the Secretary of Defense and NATO Defense Ministers on the USS Mt Whitney and USS Enterprise where the Joint STARS team successfully displayed Joint STARS data from a ship-mounted Ground Station Module (GSM) shelter and provided briefings for the Defense Ministers and over one hundred high level distinguished visitors. Efforts to support NATO Alliance Ground Surveillance (AGS) continued throughout the year. Phase I Interoperability Study was awarded to Northrop-Grumman.

On 14 Dec 95, one E-8A and one E-8C were deployed to Rhein-Main AB to support Operation JOINT ENDEAVOR in response to a 2 Dec 95 Chairman of the Joint Chiefs of Staff (CJCS) tasker. The 4500th Joint STARS Squadron (provisional) was established and the deployment Initial Operating Capability (IOC) was declared on 27 Dec 95 in theater. The CONUS MOT&R was cancelled. MOT&R will be accomplished in theater as a secondary objective to the operational mission.

The Joint STARS program is expected to satisfy all mission requirements.

c. (U) Changes Since As Of Date --

The Joint STARS 93rd Air Control Wing was activated at Robins AFB on 29 Jan 96. F1 Aircraft was delivered to the Government with DD250 on 4 Mar 96. Over 75 sorties have been completed in support of Operation JOINT ENDEAVOR. Planning and preparation have begun to redeploy the aircraft, personnel and equipment back to Melbourne, FL at the end of Mar 96.

8. (U) Threshold Breaches:

There is a cost breach and several schedule breaches to the Defense Acquisition Executive (DAE) Acquisition Program Baseline (APB) dated 2 Oct 95. Program Deviation Reports were submitted on 21 Dec 95 and 15 Feb 96; a baseline change request is underway.

9. (U) Schedule:

b. (U) Previous Change Explanations --

Delay in SDS program due to reduction in funding by PBD 604. SLPV and GDT&E/IOT&E rescheduled to agree with OCT 89 DAB restructured program. Milestone III broken out into IIIA (Low Rate Production) and IIB (Full Production). Milestones were TBD as the Joint STARS System could not meet ADM directed schedule requirements with the inadequate funding directed in the FY 91 Amended President's Budget.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Joint STARS, December 31, 1995

9b. (U) Schedule (Cont'd):

Operational Field Demo milestone added to SAR reporting. Milestones reported as TBD were changed to reflect FY92/93 President's Budget. SLFV estimate changed from Mar 91 to Oct 91 to reflect actual start date. DT&E/IOT&E milestone changed from Jun 91 to Oct 91 to reflect actual start date. The "DT&E/IOT&E START" milestone has been replaced by four separate new milestones: "DT&E START, DT&E COMPLETE, MOT&E START, and MOT&E COMPLETE" per the recommendation of DDDR&E (T&E). Per 5000.2, Milestone IIIA has been changed to DAB Program Review, LRIP. "Software Support Facility Delivery" changed from Mar 95 to May 96 due to restructuring and rephasing resulting from the FY94 Amended President's Budget. Interim Contractor Support will be used to provide alternate support until the facility is delivered. The "Software Support Facility Delivery" has been defined as "Mission Software Support Facility (MSSF) Phase 1". The "Flight/Mission Simulator Delivery" has been defined as the "Mission Crew Training Capability (MCTC) Phase 1" and the "Joint Flight Crew Training System (J-FCTS) Phase 1". Dates have been changed from Dec 95 to May 96 as a result of the above restructuring/rephasing. Per 5000.2, "Milestone IIIB" has been changed to "Milestone III". The "Self Defense Suite (SDS) Flight Test" milestone has been deleted. Due to funding constraints, SDS now consists primarily of incrementally phased situation awareness functionality. The "Self Defense Suite (SDS) Production Decision" milestone has been deleted since SDS is an integral part of Joint STARS production decision. "First A/C delivery to ACC" (changed from TAC) from Sep 95 to Feb 96, "First Training Squadron ready for Training" changed from Dec 95 to Mar 96, and "Depot Support Date" changed from Dec 95 to Jan 96 due to delays in E-8A testing, delays in simulator deliveries, and budgetary constraints, respectively. "SDS Test Complete" has been deleted and replaced with "First SDS Installation", defined as group A installation delivered in the first production aircraft. "PMRT" has been deleted under Integrated Weapon Systems Management (IWSM) concept. The "Last Aircraft Delivery" has been deleted to match approved Acquisition Program Baseline. RAA defined as being ready to execute maintenance concept as specified in the Integrated Logistics Support Plan. As a result of the May 93 LRIP Review, the Approved Program added the following Milestones: MOT&E Start; MOT&E Complete; Milestone III; Full Rate Production Contract Award; First Aircraft Delivery to ACC; Organic Support Capability; and Follow on OT&E Start. Flight/Mission Simulator Delivery changed from May 96 to Jul 96 due to delay in Flight Crew Trainer contract award. DT&E Complete changed from Dec 94 to Sep 95, due to software integration development problems on the E-8C and limited radar assets shared with E-8A. This delay changed MOT&E Start from Apr 95 to Nov 95; MOT&E Complete from Dec 95 to Apr 96, compressing MOT&E to five months; and Milestone III changed from Jan 96 to Aug 96.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Joint STARS, December 31, 1995

9c. (U) Schedule (Cont'd):

c. (U) Current Change Explanations --

(Ch-1) Software Support Facility Delivery changed from May 96 to Jul 96 because of delays in the delivery of the Software Maintenance System and Mission Support Subsystem caused by additional support needed for contingency training and integration of last E-8C software upgrades.

(Ch-2) Flight Mission Simulator Delivery changed from Jul 96 to TBD because the contractor, Dual Inc., underestimated the software development required to build an E-8C Flight Simulator. The Dec 95 Program Deviation Report outlines this breach. The Current Estimate is being revised.

(Ch-3) Full Rate Production Contract Award changed from Jun 96 to Nov 96 with the DAE approved redesignation of Lot IV as an LRIP lot.

(Ch-4) With ACC's concurrence, First Aircraft Delivery to ACC changed from Feb 96 to May 96 to support tech order verification.

(Ch-5) First Training Squadron Ready for Training changed from Mar 96 to TBD because of a nearly one year schedule delay of the Follow-On Full Scale Development effort. This was due to program schedule adjustments caused by funding shortfalls and the use of development and production assets to support Joint STARS deployment to Operation JOINT ENDEAVOR. Impacts also delayed the following:  
Depot Support Date from Jan 96 to TBD  
Required Assets Availability from May 96 to TBD  
Organic Support Capability from Mar 97 to TBD and  
IOC milestones from Mar 97 to TBD  
A Program Deviation Report (PDR) was submitted 15 Feb 96. A baseline change request is underway.

2.

(U) For Comm, Total VHF/SINGARS: Current Objective = 5/4; Current Threshold = 3/0.

(U) For Comm, SATCOM: Current Objective = 1; Current Threshold = 0.

(U) For Mission Reliability: Current Objective = 0.88; Current Threshold = 0.78.

(U) For Sortie Generation Rate: Current Objective = 1.00; Current Threshold = 0.80.

b. (U) Previous Change Explanations --

Past estimates have met threshold values set forth in DAR approved APBs dated 27 Oct 89, 6 Mar 90, and 26 May 93. Due to the Four Star Summit, the following characteristics have been deleted and are no longer reported: MTI detection radial velocity-max radial velocity, Reliability - MTBCF, Integrated fault detection/isolation, Attacks, Track Capacity. Due to the Four Star Summit, the following characteristics have been added: SAR CEP, Communications, Mission Reliability Rate, and Sortie Generation Rate.

c. (U) Current Change Explanations -- None.

The DAB Program Review for LRIP (May 93) approved a total of five aircraft in three lots. The March 4, 1994 Under Secretary of Defense Joint STARS Program Memorandum increased the total LRIP program to six aircraft in three lots. The 15 Jun 95 Under Secretary of Defense Joint STARS Program Memorandum approved an increase in the total LRIP program to eight aircraft in four lots. This increase was prompted by multi-service operational testing and evaluation (MOT&E) slippages and the desire to preserve production continuity.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised economic inflation indices.

Schedule: Program rephased from FY94 to FY98 to accommodate reductions. Changes due to aircraft reductions and additional funding for program completions.

Engineering: Revised FSD requirements for used vs. new aircraft.

Estimating: Adjusted for current and prior year escalation changes. Budgetary reprogrammings and reductions. Revised estimate to reflect current funding. Increased requirements from realignment of Oct 89 DAB to FY92/93 PB. Realignment of funds for contract management of Defense Business Operating Fund (DBOF). Reduction of Program contract

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Joint STARS, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

support. Reprogramming of FY91 funds to the Sensor Fuzed Weapon Program. Addition of FY99 funding to extend Program operations. Reduction of FY92 funds to reflect contract manpower travel savings and reduction of FY90 to reflect actual costs. Ground Support Systems (GSS) rephased due to FY93 appropriation bill cut. FY94 BES Realignment of GSS and Product Improvement funds. SDS and maintenance Trainers rephased due to funding constraints in FY92 and FY93. Rephasing of Product and Readiness Improvement and deletion of CTOS restructure, DSD Blk 2B, 2nd & 3rd A/C Instrumentation. Additional programmed funds for Product Improvement, GSS, SDS, Misc efforts (RIP, Flight Crew, ECO), and SPO. FY94 appropriation bill cut reduced Engineering Change Orders. Reprogramming of FY90 and FY91 funds for FSD settlement plus-up. Across-the-board Air Force cuts. Realignment of funding from FY98/99 to FY95-97 to match DAB estimate. FY92 reprogramming for Small Business Innovative Research. Rephasing of FY95-00 effort due to inflation shortfall. FY94 reprogramming (SIBR), F-22UR and classified program. FY95 Congressional reduction (delayed Constant Source development, descoped Post Delivery Test Support, and added risk to contingency support). FY95 reprogramming for SBIR. Reduction in funding to support FY00-01 P3I effort. Re-estimating of FY96-00 due to inflation.

Procurement

Economic: Revised economic inflation indices.  
Quantity: Reduction from 21 to 19 aircraft (IAW PMD 21, dtd 29 Jul 91).

Schedule: Deferral of two units to FY98. Realigned production profile from FY91-FY98 to FY92-FY99. Buy profile of 17 aircraft plus two refurbished stretched to FY00. Program schedule rephased per AFSARC direction extending program from FY00 to FY03.

Engineering: Decrease in production requirements due to change from new to used aircraft platform.

Estimating: Refinement and rephasing of program estimate. Revised estimate to reflect current funding. Increase in program estimate for learning as a result of decreased quantities. Realignment to support acceleration of advanced procurement for two aircraft. Realignment of funds for contract

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Joint STARS, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

management of DBOF. Reduction of program contract support. Realignment of FY98 funding to reflect actual requirement. Realignment of Ground Support Systems effort from Flyaway to Other Weapon Systems. Funding changes in advance procurement in FY93 and out. Reductions to Self Defense Suite due to funding constraints. Program estimate for Flyaway increased to match revised schedule, and estimate for SDS revised. Revised entries/estimate to 31 Dec 91 SAR to correct variance categories. Adjusted for current and prior year escalation. Funding changes in advance procurement due to change in buy profile for FY96, 97, 00 and 01. Database plus-up for inflation estimate. Increase of one aircraft in FY94. FY95 Congressional plus-up of airframe buy-out. General reduction/acquisition reform. Adjustment to flyaway estimate due to inflation adjustment. AF adjustment of savings from advanced buy plus-up (FY96-01). Reduction to ECOs due to decrease in funding for risk. Reallocation of costs between Flyaway and Other Weapon System to account for advance buy debit/credit.

Support:

Increase to initial spares and support equipment associated with the realigned production profile. Decrease in initial spares and support equipment requirements associated with the change in new vs. used platforms. Realignment of initial spares funds for Stock Fund implementation. Reprogramming of common support equipment funds to Joint STARS. Realignment of Ground Support Systems effort from Flyaway to Other Weapon Systems. Program estimate for other costs (training, GSS, data) revised. Additional funds required for ICS in FY99 and FY00 due to revised production schedule. Reestimate of Peculiar Support Equipment (PSE) revised for current program. Increase to initial spares due to schedule extension. Rephasing of FY95-00 effort due to inflation shortfall. Reduction in support equipment due to across-the-board Air Force cuts. Across-the-board AF adjustment to initial spares. Re-estimating of FY96-05 support efforts for inflation. Reallocation of costs between Flyaway and Other Weapon System to account for advance buy debit/credit. Adjustment for FY00-05 Initial Spares Common Support Equipment, Ground Systems and Data. FY96 President's Budget changes in Initial Spares and Interim Contract Support (ICS).

13b. (U) Cost Variance Analysis (Cont'd):

**MILCOM**

**Economic:** Revised economic inflation indices.  
**Estimating:** Revised estimate to reflect current funding. Budgetary reduction of FY93 funds. Revised estimate due to consolidation of Main Operating Base (MOB) with depot. Reprogramming Depot ATF funding to Joint STARS. Addition of FY98 funding. Adjustment for current and prior year escalation. FY93 funding restored by Congress. Increase in funding for Main Operating Base (MOB) due to increase in facilities. Forward Operating Base changed to Forward Operating Locations. Decrease due to slower operational ramp-up. Decrease to program content due to increased inflation. Reduction in funding for Forward Operating Locations.

Explanation of Change:

The Current Contract Price changed from the last SAR submittal due to funded cost growth in the amount of \$38M by funding Mods P00055, 58, 69, & 75. There was also Request for Equitable Adjustment funding provided for Software Concurrency and Tech Orders Letter of Direction in the amount of \$16.1M under P00075. The other big addition was \$23.3M of Undefined Contract Actions for Built-in-test Effectivity (P00070) and Radar Asset Upgrade (P00077). Additional funding was also added for a \$9.5M SCDL masthead overrun. The Program Manager's Estimate has increased due to a schedule slip in the program to Mar 96, along with above contract additions. The Schedule and Cost Variances both improved due to a rebaselining of the program in Apr 95. The rebaselining cleared all variances occurring before Jan 95. The remaining Schedule Variance was -\$6.1M after the rebaseline and has increased to -\$16.8M. This is mainly due to bookkeeping of materials from Inventory to end items lagging behind. Specific WBS elements are 3-110 Advanced Technology Work

15. (U) Contract Information (Cont'd):

Station (ATWS), 3-210 Aircraft Subsystem, and 3-460 Lab Upgrades. The Cost Variance was -\$5.3M after the rebaseline and has since increased slightly to -\$6.5M. Some problems by the Systems/Test Engineering in Software (3-300) and Software Engineering in ATWS (3-110) and Software (3-300) have contributed to the increase in Cost Variance.

| Net Change                              | \$3.2         | \$-3.8            |

Explanation of Change:

\$526,500 was added to Contract Price Target after second award fee. ECP01, Transportable Mission Support Subsystem (TMSS), modified the contract, adding another \$40,238,499 to Contract Price Target. Contract modification also added a second deliverable. Contractor and Program Manager estimate that contract will underrun by \$3.4M at cost resulting in Estimated Price at Completion of \$117.2M. Cumulative Cost Variance improved by \$3.2M because of favorable software development performance, efficiency realized on multiple courseware projects, and savings on some common equipment. Although Cumulative Schedule Variance deteriorated by -\$3.8M, the contractor is still one month ahead of schedule to accomplish future contract milestones. The contractor has set aggressive work plan schedules with the intent of finishing the contract on or ahead of schedule.

| Net Change                              | \$-18.6       | \$-87.2           |

Explanation of Change:

The Current Contract Target Price change of \$9.7M includes Over and Above (O&A) Refurbishments, spares, miscellaneous work requests and fee. The unfavorable Cost Variance is due primarily to higher than anticipated manufacturing costs associated with O&As and O&A support tasks, Engineering Changes and Engineering & Methods labor required to standardize engineering drawings and operations sheets for production. Government and corporate management are working to improve the O&A processes. The unfavorable Schedule Variance is due primarily to delayed vendor delivery, receipt/acceptance and material not being applied as planned. The Target Price of \$516.4 includes fee.

| Net Change                              | \$-1.6        | \$1.1             |

Explanation of Change:

The Current Target Price represents the Full Procurement of Aircraft P3 and P4 (\$358.1M), additional Over and Above Refurbishment costs, aircraft configuration update, ASIP, Work Request & Modifications, and spares. The unfavorable Cumulative Cost Variance net change reflects refurbishment and modification material received ahead of the projected cumulative spend plan, higher than anticipated overhead

Explanation of Change:

The Target Price change of \$428M includes Lot III Full Procurement, P6 Rewire and Configuration Update, Spares, PSE and Over and Above (O&A) Refurbishments of the P5 and P6 Aircraft. The Cumulative Schedule Variance change of -\$1.8M is attributable to O&A dispositioning and parts identification and verification being behind schedule which effects Refurbishment, Reinstallation, Aircraft Modification. Also, late release of engineering drawings influenced the Cumulative Schedule Variance change. Management has implemented a new Aircraft positioning flow with a dedicated team assigned to each position to correct these variances. The engineering drawings have all been released. The Cumulative Cost Variance change of -\$6.3M is attributable to poor work efficiency resulting from engineering change orders, material shortages, out of sequence work arounds, and the unfavorable labor rates currently being used. This contract is a Firm Fixed Price contract. The Target Price of \$551.2M includes fee.

| Cumulative Variances To Date  | \$2.3         | \$-0.6            |
| Net Change                    | \$2.3         | \$-0.6            |

Explanation of Change: None.

The Initial and Current Target Price (0.0) reflects an undefinitized Advance Buy period for Lot IV. However, the Not To Exceed and Estimate at Complete (EAC) price of \$163.8M includes Lot IV Advance Buy (\$143.7M) and Over and Above (O&A) Refurbishments (\$20.1M) of the P7 and P8 Aircraft. The favorable Cost Variance reflects impact of job shoppers and slow start of program management. The Lot IV contract is a Firm Fixed Price (FFP) contract.

This is the first time this contract is being reported in the SAR.

17. (U) Production Rate Data:

a. (U) Deliveries to Date --

|             |             |
|-------------|-------------|
| EDT&E       | Plan/Actual |
| Procurement | 0/0         |
|             | 1/1         |

DD250 of P1 was completed on 4 Mar 96.

b. (U) Approved Design-to-Cost Objective -- N/A.

18. (U) Operating and Support Costs:

a. (U) Assumptions and Ground Rules --

O&S costs were based on 19 refurbished Boeing 707 aircraft. The support concept priced assumed Government two level (organizational/depot) support of the prime mission equipment (PME). The airframe support will be Government organizational level support, a mixture of Government and contractor support for organizational (off-equipment) maintenance, and contractor support for depot level requirements. The O&S costs of the PME and airframe were estimated individually and then added together to estimate the total system level O&S costs. The PME costs were estimated using JPO Developed Repairable Support Division (RSD) Model to calculate the AF Stock Fund Life Cycle Costs. The airframe costs were estimated by the Government using the Cost-Oriented Resources Estimating (CORE) model contained in AFR 173-13, which is now AFI 65-503. The planned buy program was used to estimate the actual O&S costs. Significant O&S cost categories include: Personnel, Unit Consumption, Depot Maintenance/Contractor Support, and Sustaining

| Sustaining/Indirect Spt | 71.8   | N/A                               |
| Total                   | 334.3  | N/A                               |

c. (U) Contractor Support Costs -- None.

Contractor Support of \$47.9M is separately identified and includes CLS for Mission Software Software Support Facility, Mission Crew Training System, Software Support Facility, Maintenance Trainers, Flight Simulator, and Aircraft.

There is no antecedent system to Joint STARS; this system is a new capability.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --  
During formulation of the FY85 Program Objective Memorandum, the Air Force segregated the development of conventional submunitions from the development and integration of these submunitions into a weapon system. This decision was made to preclude termination of promising submunition designs in the event of termination of its carrier. The Risk Reduction Phase, the first of two development phases, was successfully completed in Sep 85. In Oct 85, after a successful Preliminary Design Review (PDR), SAF authorized the SFW program to proceed into Full Scale Development (FSD) in Nov 85. The Dec 86 Selected Acquisition Report (SAR) implemented the new Development Estimate Baseline.

The program experienced test failures, schedule delays, and budget changes and was restructured in Jun 89. The restructure was approved by SAF/AQ in Nov 89 and included a Production Transition Program (PTP) to reduce cost and the risk of transitioning to production. The culmination of these events resulted in a schedule breach and a Nunn-McCurdy Program Acquisition Unit Cost (PAUC) breach. PTP completed Mar 93. As a result of PTP successes, the PTP configuration was introduced into the SFW baseline in Lot 1, two LRIP lots ahead of schedule.

Development Test and Evaluation (DT&E) testing began in Dec 88 and was successfully completed Apr 91. The SFW was certified ready for Initial Operational Test and Evaluation (IOT&E) by the Program Executive Officer (PEO) in Aug 90. IOT&E Phase 1 successfully completed Dec 91.

The Defense Acquisition Board (DAB) authorized Low Rate Initial Production (LRIP) in Mar 92 and directed the incorporation of a

\*\*\* UNCLASSIFIED \*\*\*

Sensor Fuzed Weapon, December 31, 1995

7a. (U) Program Highlights (Cont'd):

Producibility Enhancement Program (PEP) to further improve the producibility of the SFW design. The acquisition objective was reduced from 16,726 to 10,000 weapons resulting in a Runn-McCurdy PAUC breach.

LRIP 1-3 contract awards occurred on schedule. LRIP 1 was awarded Mar 92 (98 weapons) and modified to incorporate LRIP 2, Jan 93 (22 weapons). LRIP 3 was awarded in Dec 93 (112 weapons).

The FY94 President's Budget (PB) reflected a quantity reduction from 10,000 to 5,000 weapons and a reduction in near-term funding. The reduced quantities and slower ramp rate resulted in a Runn-McCurdy PAUC and an Acquisition Program Baseline (APB) Average Unit Procurement Cost (AUPC) breach.

Testing of five PTP verification units was successfully completed in Jun 93 with performance exceeding user requirements. HAVE NOTE testing, which is testing of the Bomb Live Unit (BLU)-108/B) submunition and projectile in an electromagnetic environment, successfully completed in Mar 93.

The Mar 92 Acquisition Decision Memorandum (ADM) directed a status briefing on PEP. PEP status was presented to the Office of the Secretary of Defense (OSD), Conventional Systems Committee (CSC) in Nov 93.

SFW LRIP 1 Production Qualification Tests (PQT) were successfully completed in Apr 94, with weapons exceeding user requirements and SFW officially entered production. LRIP 1 experienced a Lot Acceptance Test (LAT) failure in Jun 94. The weapon did not meet reliability requirements; however, the weapon still exceeded the user's kills-per-pass requirement. Corrective actions were implemented in a production verification unit which passed LAT requirements in Sep 94. Another test was conducted and the first lot was accepted after successful LAT. Lots 2 and 3 completed LAT in Oct and Nov 94. PEP 1 completed contractor qualification testing for the Safe and Arm device in Aug 94. PEP 2 Phase 1 completed brassboard testing of the integrated submunition electronics and Phase 2 was awarded in Sep 94. FY96 PB reduced SFW production ramp-up quantities and stretched the program two years.

b. (U) Significant Developments Since Last Report --  
In Jan 95, two Lot Acceptance Test (LAT) units for the fourth lot of Low Rate Initial Production (LRIP) 1 failed to meet reliability criteria for Government lot acceptance. Despite the LAT failure, the weapons continued to exceed user kill requirements. Production was halted until corrective actions were identified and implemented.

\*\*\* UNCLASSIFIED \*\*\*

Sensor Fuzed Weapon, December 31, 1995

7b. (U) Program Highlights (Cont'd):

Deliveries resumed the end of May 95, and LRIP 1 deliveries were completed in Jun 95.

The program experienced a LAT failure for LRIP 2 (Lot 6) on 11 Jul 95. The munition failed to dispense submunitions correctly after one of the Tactical Munitions Dispenser (TMD) skin panels impacted the munitions tail upon initial opening. Corrective actions were implemented and proper TMD functioning was verified through ground and flight tests. Lot 6 was delivered to the Government in Oct 95. LAT 7 was successfully conducted in Dec 95.

Producibility Enhancement Program (PEP) 1 configuration was finalized and the first unit was delivered 5 May 95. Testing of PEP 1 units began in early Jun 95. Four tests out of a five-weapon test series have been completed. PEP 2 experienced difficulties in designing the Application Specific Integrated Circuit (ASIC). The ASIC approach was dropped in favor of a multichip-module layout. PEP 2 has started prototype manufacturing.

The SFW P3I program, which will enhance BLU-108 performance through a dual-mode sensor, multimission warhead, and an enhanced footprint, has been negotiated and will be awarded in Apr 96. The Milestone III decision was delegated to the Air Force and the Program Office initiated efforts to tailor and streamline the review process. The Milestone Decision Review was moved from Dec 95 to May 96, due to asset non-availability resulting from the LAT failure. This will allow the Director of Operational Test and Evaluation (DOT&E) sufficient time to complete the Beyond Low Rate Initial Production report.

The SFW program will satisfy all mission requirements.

c. (U) Changes Since As Of Date -- None.

8. (U) Threshold Breaches:

There is a procurement cost breach (+6.6%) to the Approved AFAP Acquisition Program Baseline (APB) dated 4 Oct 93. This is due to a reduction in the annual buy profile and subsequent stretch of the program by two years. A Program Deviation Report (PDR) and Baseline Change Request (BCR) will be submitted for approval. There are no Nunn-McCurdy unit cost breaches.

9a. (U) Schedule (Cont'd):

| (U) Milestones (Cont'd) --              | Development<br>Estimate | Approved<br>Program | Current<br>Estimate |
|---|-------------------------|---------------------|---------------------|
| Lot 3 Contract Award                    | N/A                     | DEC 93              | DEC 93              |
| Milestone III                           | N/A                     | DEC 95              | MAY 96 (Ch-1)       |
| Lot 4 Contract Award                    | N/A                     | DEC 94              | JAN 95              |
| (b)(1)                                  |                         |                     |                     |
| Lot 1 Initial Production First Delivery | N/A                     | JUN 94              | JUN 94              |

b. (U) Previous Change Explanations --

The Critical Design Review (CDR) date was moved from Jul 87 to Oct 87 based on contractor hardware procurement and test delays. It was then slipped from Oct 87 to Mar 88 due to design problems on the BLU-108/B structure and verification/validation of design improvements. DT&E/IOT&E completion slipped from Jun 89 to Apr 90 due to the CDR adjustment, the necessity to accommodate a cold weather test environment requirement and nonavailability of DT&E test assets delaying DT&E start. The Program Review (Milestone IIIA) was slipped from Nov 88 to Aug 89 due to the slip in CDR. The subsequent slip from Aug 89 to Mar 90 allowed more of the IOT&E testing to be completed prior to the Program Review. The Production Contract Award milestone was changed from Dec 88 to Dec 90 as a direct result of the slips in CDR and IOT&E. CDR was held Apr 88 with final design approval Aug 89. As a result of two test failures, design changes, schedule delays and budget impacts, the program was restructured. This restructure slipped DT&E/IOT&E completion to Jan 92 and submission of final test reports to Mar 92, DAB Program Review to Sep 91, and Production Contract Award to Dec 91. Due to the FY91 PB impact, the IOC estimate was revised by HQ ACC. IOT&E was delayed until Tactical Munitions Dispenser (TMD) anomalies found in early SKEK EAGLE testing were resolved and a plan for completing the F-16 Operational Flight Plan software was finalized. The DAB Program Review, Production Contract Award, Lot 2 and 3 Contract Awards and IOC slipped because of the desire to have a negotiated LRIP 1 contract prior to the CSC Review on 19 Dec 91 and the impact of the FY93 PB. Program Management Responsibility Transfer (PMRT) was eliminated as a milestone because it was no longer applicable following Air Force Systems Command/Air Force Logistics Command (AFSC/AFLC) consolidation to Air Force Material Command (AFMC). LRIP 2 and 3 contract awards were realigned to ensure that there would be no production break. The ADM dated 26 Mar 92 directed a four year LRIP program vice the three year LRIP program as originally planned. This resulted in a Milestone III DAB change from Dec 94 to Dec 95. As a result of the DAB Program Review, the IOC date was more refined. Lot 2 contract award date

\*\*\* UNCLASSIFIED \*\*\*

Sensor Fuzed Weapon, December 31, 1995

9b. (U) Schedule (Cont'd):

a negotiated LRIP 1 contract prior to the CSC Review on 19 Dec 91 and the impact of the FY93 PB. Program Management Responsibility Transfer (PMRT) was eliminated as a milestone because it was no longer applicable following Air Force Systems Command/Air Force Logistics Command (AFSC/AFLC) consolidation to Air Force Material Command (AFMC). LRIP 2 and 3 contract awards were realigned to ensure that there would be no production break. The ADM dated 26 Mar 92 directed a four year LRIP program vice the three year LRIP program as originally planned. This resulted in a Milestone III DAB change from Dec 94 to Dec 95. As a result of the DAB Program Review, the IOC date was more refined. Lot 2 contract award date was changed from Apr 93 to Jan 93 due to modification to the LRIP 1 contract versus negotiating a separate contract. Lot 1 Initial Production First Delivery was added as an approved Acquisition Program Baseline (APB) milestone. Lot 4 contract award slipped 2 weeks from 31 Dec 94 to 11 Jan 95. The effective start date was 30 Dec 94.

c. (U) Current Change Explanations --

(Ch-1) Milestone III decision slipped from Dec 95 to May 96, due to asset non-availability resulting from the LAT failure. This will allow the Director of Operational Test and Evaluation (DOT&E) sufficient time to complete the Beyond Low Rate Initial Production Report.

b. (U) Previous Change Explanations --

Airspeed was changed to 200-650 KCAS (threshold) and 200-700 KCAS (goal) per the 11 May 89 SORD. Aircraft compatibility was changed by deleting the F-4 and adding suffix designators for the A-7, F-15, F-16, and F-111. The A-7 and B-52 aircraft requirements were deleted per HQ Air Combat Command (ACC) Msg 131313Z Nov 89 and HQ SAC Msg 291356Z Dec 89. The USMC/USN aircraft elements were added per the 11 May 89 SORD. The System Reliability threshold has changed from 0.90 to 0.94 per ACC message and has been included in the SORD. Corrected administrative errors and corrected the expanded Current Estimate description erroneously left out of the Dec 91 SAR. Aircraft Compatibility was changed to add bomber aircraft. Lethality - Kills-Per-Pass (Countermeasured Environment) was added as an approved APB Performance Characteristic.

b. (U) Previous Change Explanations --

RDT&E

Economic: Revised escalation indices.

Quantity: Increased RDT&E units by five for Life Cycle Surveillance Testing and eight units for IOT&E.

Estimating: Offset to quantity increase - reduced management flexibility in executing program; adjusted for current and prior year escalation; funds added in FY87 Appropriations Bill to accelerate SFW program development; adjusted for Air Force assessments - reduced scope of effort to accelerate SFW development; increased funds for SEEK EAGLE test requirements; increased funds for Pre-Production Process Verification, additional testing and SPO

13b. (U) Cost Variance Analysis (Cont'd):

support requirements; increased RDT&E funds for Multi-Staged Improvement Program (MSIP); increased funds to support ACC in accomplishing the Cost & Operational Effectiveness Assessment (COEA); adjusted for program assessment (ANSER) and Air Staff Budget Authority; funds removed in order to support Desert Storm; increased for negotiated Request for Equitable Adjustments (RFEA); adjusted to equal actual expended dollars; funds moved from RDT&E to Procurement appropriation to pay for acquisition support contractors in FY96-02.

Procurement

**Economic:** Revised escalation indices; economic adjustment for negative program change.

**Quantity:** Increased flyaway costs to procure 5,803 additional SFWs in accordance with the revised PMD to incorporate latest assessment of Air Force quantity requirements; total quantities reduced from 19,803 to 16,726; procurement objective reduced from 16,726 to 10,000 weapons; quantity reduced from 10,000 to 5,000 weapons.

**Schedule:** Impact of revised schedule in accordance with the revised PMD to incorporate latest assessment reflected in FY88-92 Non-nuclear Consumables Annual Analysis (NCAA); first procurement buys scheduled for FY89 changed to FY91; production schedule increased by one year; rephased procurement buy schedule; corrected variance categorization in Dec 89 SAR; production extended two years to reach quantity of 10,000 under current budget constraints; PEP program reduced unit cost allowing increased annual quantities within the current PB; schedule changes associated with decreased quantity; procurement buy schedule changed due to slower ramp up quantity; change in annual procurement buy profile which increased ramp quantities and deleted three years of procurement; reduced annual quantities and added two years of procurement.

**Estimating:** New pricing methodology used Risk Reduction hardware actuals; competition started two years earlier; costs savings resulted from a revised Alternate Source Strategy; estimating change associated with reduction in quantities from 19,803 to 16,726 since SAR baseline; corrected variance categorization in Dec 89 SAR; current acquisition strategy and the incorporation of production

Sensor Fused Weapon, December 31, 1995

13b. (U) Cost Variance Analysis (Cont'd):

transition reflected a net savings; cost estimate updated to reflect: acquisition strategy change and incorporation of negotiated LRIP 1 contract; PEP reduced current flyaway costs; adjusted for current and prior inflation; LRIP 1 incorporation increased subcontract actual cost; inclusion of actuals from LRIP's 1, 2, and 3 and their impact on outyear procurement; incorporated impact of lower production rate on outyear costs; addition of funds needed for Producibility Enhancement Program.

Support: Increased data costs associated with 5,803 SFWs added to the program; price adjusted based on actuals; decreased data cost associated with the reduced quantities; decreased data costs associated with reduced hardware costs; adjusted for current and prior inflation; decreased data costs associated with three years less procurement; increase in data costs associated with two additional years of procurement.

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Sensor Fuzed Weapon, December 31, 1995

15. (U) Contract Information (Cont'd):

Explanation of Change:

The changes in Current Contract Target and Ceiling Price are due to the addition of JSOW BLU-108 requirements. Changes in Estimated Price At Completion for Contractor and Program Manager are due to contractor underrun.

The favorable Cost Variance decreased due to additional requirements for the TMD due to LAT 6 failure. A favorable \$5.2M variance is forecasted at completion.

The unfavorable Schedule Variance decreased due to the resolution of the LAT failure and delivery of Lot 6.

NOTE: The FPIF portion of the LRIP contract is for the 120 weapons, the FFP is for data and warranty, the CPAF is for the PEP Phase 1 and Phase 2 (Subphase 1) efforts, and the time and materials (T&M) is for the Environmental Protection Program. Contract costs include funding for the JSOW and SEEK EAGLE programs.

Since this contract is over 90 percent complete, this is the final time this contract will be reported in the SAR.

| (U) LRIP 3:<br>Textron Defense Systems, Wilmington, MA<br>F08626-94-C-0006, FPIF/FFP<br>Award: December 30, 1993<br>Definitized: December 30, 1993 | Initial Contract Price |         |     |
|--|------------------------|---------|-----|

| Cumulative Variances To Date (12/31/95) | \$5.1         | \$-4.6            |
| Net Change                              | \$5.5         | \$-4.6            |

Explanation of Change:

The changes to Current Target, Ceiling Price, and Estimated Price at Completion for both Contractor and Program Manager increased due to addition of SEEK EAGLE units, second source battery qualification, TMD industrial base study, OT&E test support, and PEP 2 cost growth.

The favorable Cost Variance increased primarily due to the diversion

\*\*\* UNCLASSIFIED \*\*\*

\*\*\* UNCLASSIFIED \*\*\*

Sensor Fused Weapon, December 31, 1995

15. (U) Contract Information (Cont'd):

of level of effort manpower to LRIP 2 failure analyses due to the LAT 6 failure.

The unfavorable Schedule Variance increased due to the delay in completion of tactical units at the Load, Assembly, and Packing (LAP) Facility because of diversion of manpower to help facilitate LRIP 2 failure analyses and corrective action activities.

|   |  |  | Cost Variance                 |                 |     |
| Previous Cumulative Variances           |  |  | N/A                           | N/A             |     |
| Cumulative Variances To Date (12/31/95) |  |  | \$1.5                         | \$1.9           |     |
| Net Change                              |  |  | \$1.5                         | \$1.9           |     |

Explanation of Change:

The changes to current target, ceiling price, and estimated price at completion for both Contractor and Program Manager is due to addition of SEEK EAGLE units, cold temperature testing, and JSOW test hardware.

The favorable Cost Variance is due to production integration and floor team support efforts that are lagging due to LRIP 1/2 rework and LRIP 3 recovery activities. The scaling back of the production rate review as well as fewer requirements than planned should result in a favorable variance at completion.

The favorable Schedule Variance is due primarily to early receipt of proximity fuses from the vendor, early receipt of shipping containers, early receipt of materials and an early start of projectile production.

FY95 and FY96 funds have a separate appropriation (3011, Procurement of Ammunition, AF). However, SAR software does not include this new Appropriation, therefore FY95-03 Procurement was left in the Appropriation 3020 (Missile Procurement, AF) in order to make valid comparisons with the Dec 94 SAR.

17. (U) Production Rate Data:

- a. (U) Deliveries to Date --
- |             | <u>Plan/Actual</u> |
|-------------|--------------------|
| EDT&E       | 155/155            |
| Procurement | 203/133            |
- b. (U) Approved Design-to-Cost Objective -- N/A.
- There was no formal DTC objective established for SFW.

18. (U) Operating and Support Costs:

- a. (U) Assumptions and Ground Rules --

The SFW is a no maintenance/wooden round weapon. As such, it will require: no scheduled maintenance; limited unscheduled repairs and stockpile sampling; no shop or operational checkout, testing or test equipment; preload checks and tasks limited to quick visual checks. Field level maintenance activities will be restricted to unscheduled, exterior, on-equipment activities - i.e. corrosion control, desiccant change in the storage container, and lug and lanyard replacement. No special training, support equipment, or personnel are required to maintain the SFW system. The SFW will be compatible with existing munitions handling/loading equipment. All support equipment needed to support the SFW is already in the inventory.

The elements that account for the Operating and Support (O&S) costs are warranty testing (\$83.00), disposal costs (\$20.00), manpower (\$12.00) and second destination transportation (\$4.00). Distributing those costs over five thousand weapons with a ten year shelf life yields a cost of approximately \$119.00 (BY79\$) per weapon per year. The latest cost estimate for the O&S costs is dated 9 Nov 95.

E-2C AEW (HAWKEYE), December 31, 1995

5. (U) Related Programs:

C-2A Grayhound; Improved Engine (PE0604252N)

6. (U) Mission and Description:

The Grumman built E-2C "Hawkeye" is a twin-engine, carrier-based, Combat-Information-Center aircraft which extends task force defense perimeters by providing early warning of approaching enemy air and surface units and vectoring interceptors and strike aircraft to the attack. Carrying a crew of five, the E-2C also provides area surveillance, intercept, search and rescue, communication relay, and strike/air traffic control. Principal subsystems include APS-125/138/139/145 radar and ALR-73 Passive Detection Systems which allow the E-2C to detect emitters/targets well beyond radar range.

In order to take advantage of improved sensor and communication capabilities resulting from the Update Development Program (UDP II), to exploit emerging Commercial Off-The-Shelf technologies, and to address supportability issues with the current mission computer, plans and funds exist to replace the E-2C weapon system's antiquated tactical computer (which predates the E-2C aircraft). The replacement computer's hardware and software will be integrated into the onboard subsystems encompassing complex sensor inputs and outputs.

7. (U) Program Highlights:

a. (U) Significant Historical Developments --

The E-2C was introduced to the fleet in 1973. The automatic overland radar target tracking and Electronic Counter Counter-Measure (ECCM) features were introduced to the fleet in 1977 with the new AN/APS-125 Radar Advanced Radar Processing Systems (ARPS). The designation of the AN/APS-125 radar was changed to the AN/APS-138 in 1983 with the production incorporation and delivery of the Total Radiation Aperture Control Antenna (TRAC-A) and other radar changes. The AN/APS-139, delivered to the fleet in December 1988, improved radar ECCM performance and increased system track capacity. The first limited production AN/APS-145 aircraft was accepted in November 1990.

Update Development Program (UDP) Group II APS-145 completed OT-IIC operational testing in November 1990. The APS-145 increases the maximum radar range, improves the identification friend or foe system, automates radar system optimization and improves radar tracking. The UDP and T56-A-427 Engine Upgrade reached OPEVAL concurrently in FY-92. The E-2C satisfies the mission needs.

The E-2C reached 90% completion on December 20, 1991 and submitted its last SAR. The approved E-2C new production began with advance procurement in FY 94. The procurement of 36 aircraft started with four aircraft being procured in FY 95, the last aircraft will be

E-2C AEW (HAWKEYE), December 31, 1995

7a. (U) Program Highlights (Cont'd):

procured in FY 03.

The current Litton L-304 Computer Processor (CP) in the E-2C is based on 1960's vintage technology. As E-2C sensors and communications systems have become increasingly sophisticated and complex, the L-304 has become saturated in terms of available memory and processing power and is unable to support the full range of sensor and communication systems computing requirements. While some piecemeal improvements have been attempted, they are still inadequate to support computer performance requirements, and the technology of the basic CP is rapidly becoming unsupportable. Continuing advances in computing technology, primarily driven by advances in commercial initiatives, allow orders of magnitude increase in computing capacity at dramatically reduced space and weight. These space and weight reductions are required to enable required upgrades including cooperative engagement capability and satellite communications. Significant growth capacity and life cycle cost savings can be realized by leveraging commercial technology advancements using an "open architecture" design philosophy with Commercial Off the Shelf components.

Studies initiated in the late 1980's confirmed the need for an upgrade to the current E-2C computer and possible upgrade approaches. Funding was identified and a Mission Computer Upgrade (MCU) Milestone IV/II was approved by ASN(RDA) September 94, with an Engineering and Manufacturing Development (EMD) contract for MCU development and integration signed with Grumman Aerospace Corporation November 94. Low rate initial production is scheduled for FY 97 and FY 98, and final system testing is planned for FY 99. Full rate production and Initial Operational Capability is planned for FY 00.

b. (U) Significant Developments Since Last Report --  
None

This system will satisfy mission requirements.

c. (U) Changes Since As Of Date --  
The two (2) FMS aircraft budgeted in FY 00 are as yet unidentified; however, France has expressed intentions of purchasing two additional aircraft. France has not indicated in what year they will purchase the aircraft. Without FMS sales in FY 00 the unit cost of our aircraft purchases will increase approximately 8%.

The last E-2C aircraft will be procured in FY 04.

E-2C AEW (HAWKEYE), December 31, 1995

15. (U) Contract Information (Then-Year Dollars in Millions):

a.(U) RDT&E --  
 (U) Mission Computer Upgrade:  
 Grumman Aerospace Corp, Bethpage, NY  
 N00019-93-C-0205, CPIAF  
 Award: November 30, 1994  
 Definitized: November 30, 1994

| Current Contract Price |                |            | Estimated Price At Completion |                        |
|------------------------|----------------|------------|-------------------------------|------------------------|
| <u>Target</u>          | <u>Ceiling</u> | <u>Qty</u> | <u>Contractor</u>             | <u>Program Manager</u> |
| \$155.2                | \$0.0          | 0          | \$140.0                       | \$140.0                |

Initial Contract Price  
Target      Ceiling      Qty  
 \$155.2      \$0.0      0

|   | <u>Cost Variance</u> | <u>Schedule Variance</u> |
|---|----------------------|--------------------------|
| Previous Cumulative Variances           | \$0.0                | \$0.0                    |
| Cumulative Variances To Date (12/31/95) | \$1.4                | \$-2.2                   |
| Net Change                              | \$1.4                | \$-2.2                   |

Explanation of Change:

Cost: The positive CV was due to a variance in overhead during the November reporting period. Since contract start, a majority of the cumulative cost variance has been due to indirect rate fluctuations. If indirect costs are excluded from the calculation of CPI, it equates to 1.02. The Contract Work Breakdown Structure (CWBS) elements are the primary contributors to the cumulative CV.

Schedule: Indirect costs account for 67% of the cumulative SV. Indirect SV will not impact program schedule. The -\$1,427K indirect SV is indirect cost that has not yet been applied to behind schedule direct costs. The SPI equates to 0.94 if indirect costs are excluded from the calculation. Prime Mission Product Application software effort is of most concern due to negative float conditions.

b.(U) Procurement --  
 (U) FY 95 PRODUCTION A/C:  
 GRUMMAN AEROSPACE CORP, BETHPAGE, NY  
 N00019-94-C-0020, FFP  
 Award: December 16, 1994  
 Definitized: N/A

| Current Contract Price |                |            | Estimated Price At Completion |                        |

The two (2) FMS aircraft budgeted in FY 00 are as yet unidentified; however, France has expressed intentions of purchasing two additional aircraft. France has not indicated in what year they will purchase the aircraft. Without FMS sales in FY 00 the unit cost of our aircraft purchases will increase approximately 8%.
